Major Risks Factors for ASCVD

Major Risk Factors	Additional Risk Factors	Non-traditional Risk Factors
Advancing age	Obesity, abdominal obesity	↑ Lipoprotein (a)
↑ Total serum cholesterol	FHx hyperlipidemia	↑ Clotting factors
↑ Non-HDL-C	↑ Small, dense, LDL-C	↑ Inflammatory markers (hsCRP, Lp-PLA2)
↑ LDL-C	↑ Apo B	↑ Homocysteine levels
Low HDL-C	↑ LDL particle concentration	↑ Uric acid
Diabetes mellitus	↑ Fasting/post-prandial hypertriglyceridemia	↑ TG-rich remnants
Hypertension	PCOS	
Chronic kidney disease, 3,4	Dyslipidemic triad	
Cigarette smoking		
Family history of ASCVD		

Burden of ASCVD

- ▶ US 2016:
 - ▶ 660,000 new coronary events
 - ▶ 305,000 recurrent events
- ▶ Annual incidence of MI: 550,000 new attacks
200,000 recurrent attacks
- ▶ >100 million US adults >20 years have total cholesterol >200 mg/dL
>30 million have total cholesterol >240 mg/dL

10-year risk calculators

Carrier 11:58 PM

10-Year Risk for Incident Hard ASCVD

Age: 46 Race: AA Sex: M

Chol (mg/dL): 210 HDL (mg/dL): 36 SI Units:

Risk Reference

ASCVD Risk Categories and LDL-C targets

Risk Category	Risk Factors/ 10-year risk	Treatment Goals		
		LDL	Non-HDL	Apo B
Extreme Risk	<ul style="list-style-type: none"> Progressive ASCVD including unstable angina after achieving LDL <70 CVD in patients with DM, CKD 3 or 4, HeFH Hx premature ASCVD (<55 M, <65 F) 	<55	<80	<70
Very High Risk	<ul style="list-style-type: none"> Established CAD or recent hospitalization for ACS, carotid or peripheral intervention, 10-y risk >20% DM or CKD ³/₄ with 1 or more RFs HeFH 	<70	<100	<80

ASCVD Risk Categories and LDL-C targets

Risk Category	Risk Factors/ 10-year risk	Treatment Goals		
		LDL	Non-HDL	Apo B
High Risk	<ul style="list-style-type: none"> • ≥ 2 risk factors and 10-y risk 10-20% • DM or CKD 3/4 with no other RFs 	<100	<130	<90
Moderate Risk	<ul style="list-style-type: none"> • ≤ 2 risk factors and 10-y risk <10% 	<100	<130	<90
Low Risk	<ul style="list-style-type: none"> • 0 risk factors 	<130	<160	NR

Who should be screened?

- ▶ Patient with suspicion for Familial Hypercholesterolemia
- ▶ Annual screening of all adults with type II diabetes
- ▶ Young adults (Men 20-45, Women 20-55):
 - ▶ Every 5 years
- ▶ Middle-Age Adults (Men 45-65, Women 55-65):
 - ▶ Without ASCVD RFs every 1-2 years
 - ▶ With ASCVD RFs every year
- ▶ Older adults (>65):
 - ▶ Annual screening if 0-1 ASCVD RFs
 - ▶ More frequent screening if more RFs

Outline

- ▶ Who should you screen?
- ▶ **What tests should you order?**
- ▶ Who should you treat?
- ▶ Which drugs should you use?
- ▶ What are the controversies?

The Fasting Lipid Panel

- ▶ Total Cholesterol
- ▶ HDL-C
- ▶ TG
- ▶ LDL -C (calculated)

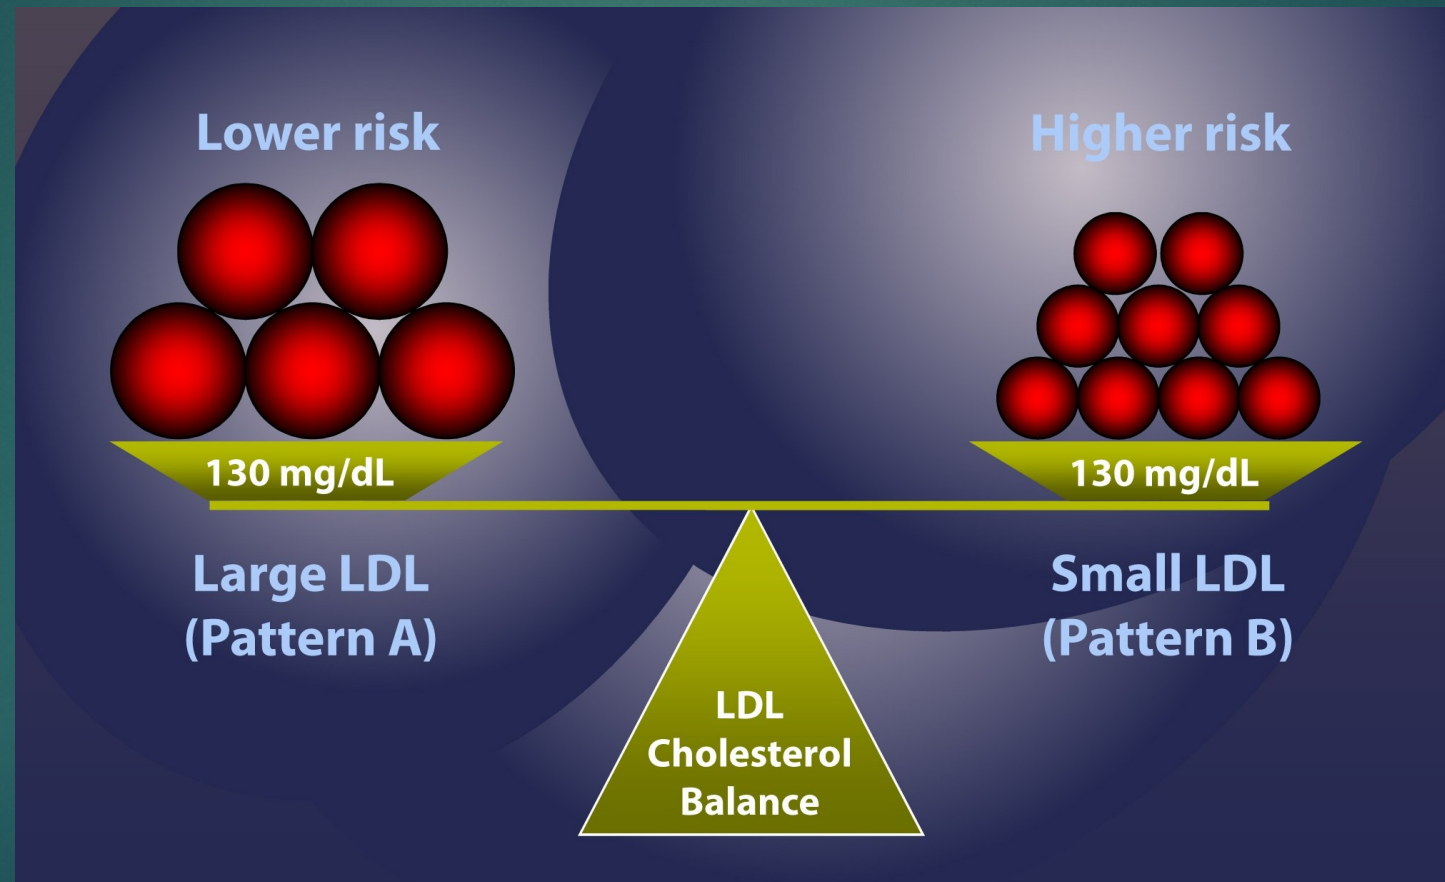

Beyond the Fasting Lipid Panel

- ▶ Direct LDL measurement
- ▶ **LDL particle number (LDL-P)**
- ▶ LDL particle size
- ▶ **Lp(a)**
- ▶ CAC score
- ▶ LPLA2
- ▶ **Apo B**
- ▶ Homocysteine
- ▶ hs-CRP

LDL particle number (LDL-P)

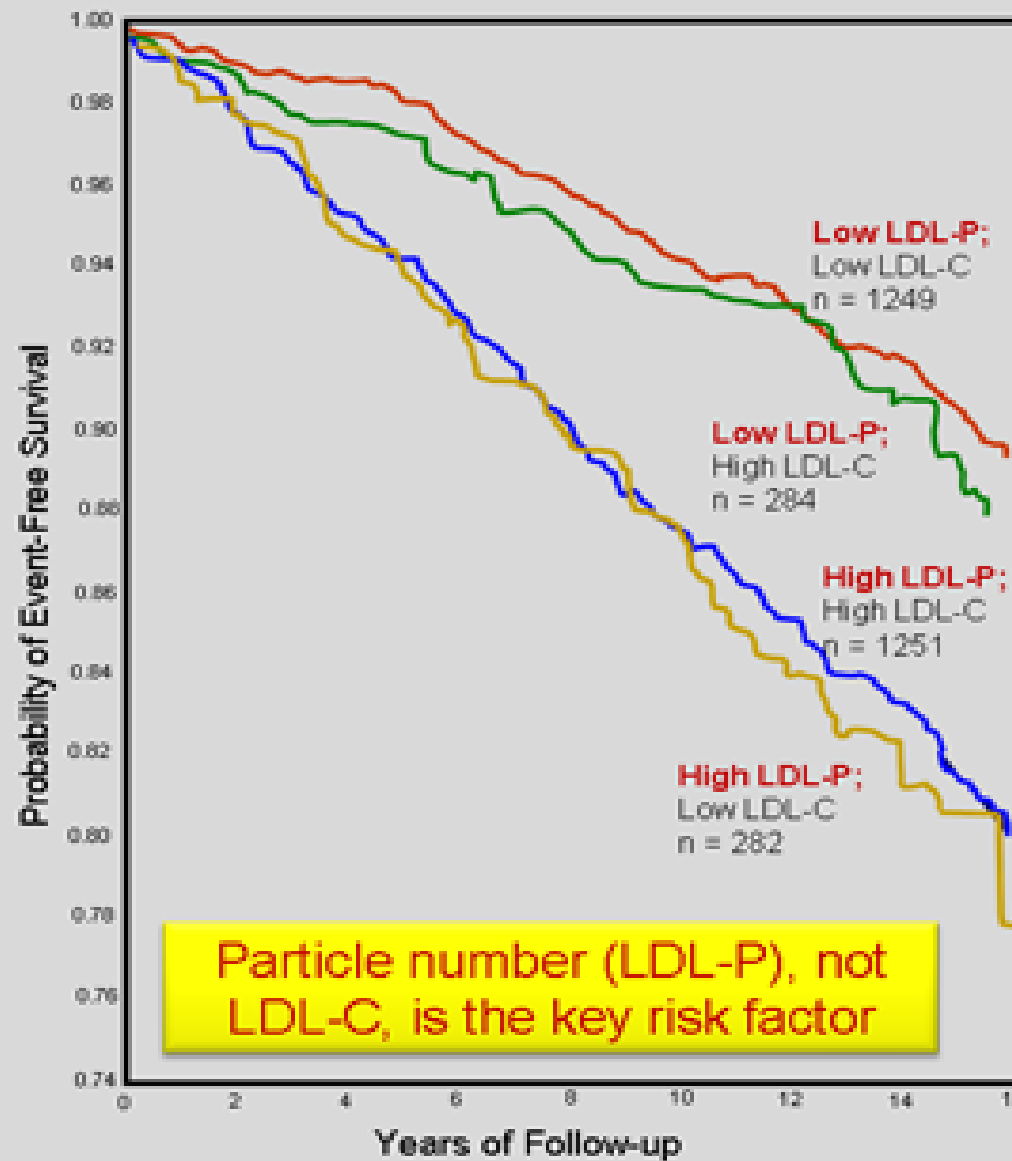

- ▶ Measured by one of 4 methods:
 - ▶ Gradient gel electrophoresis
 - ▶ NMR spectroscopy
 - ▶ VAP panel (ultracentrifugation)
 - ▶ Ion mobility
- ▶ Better predictor of cardiovascular disease than LDL-C
- ▶ Optimal is < 1000 nmol/L

Higher LDL-P (with similar LDL-C) confers higher cardiovascular risk

Framingham Heart Study Offspring Cohort

Event-free survival among participants with low-density lipoprotein cholesterol (LDL-C) and LDL particle number (LDL-P) above or below the median. Median values were 131 mg/dL for LDL-C and 1414 nmol/L for LDL-P.

LDL-P was strongly associated with increased CVD risk in both men and women ($p < 0.0001$).

When data for men and women were combined, LDL-P was approximately twice as strongly related to CVD incidence as LDL-C.

Case

- ▶ 52 yo woman seen to assess her risk of CVD
- ▶ Healthy and fit, no significant PMH
- ▶ BMI 21, 112/70, normal exam
- ▶ Father died at 54 (“he was the picture of health”)

- ▶ Fasting labs **TCHOL 192, LDL 104, HDL 57, TG 26, 10-y risk 0.8%**
- ▶ **Would you treat?**

LDL-P 2100 nmol/L. Started on moderate-intensity statin

LDL Particle Size Subclass

IDL

L3

large,
buoyant

L2

small, dense

L1

A ← AB → B

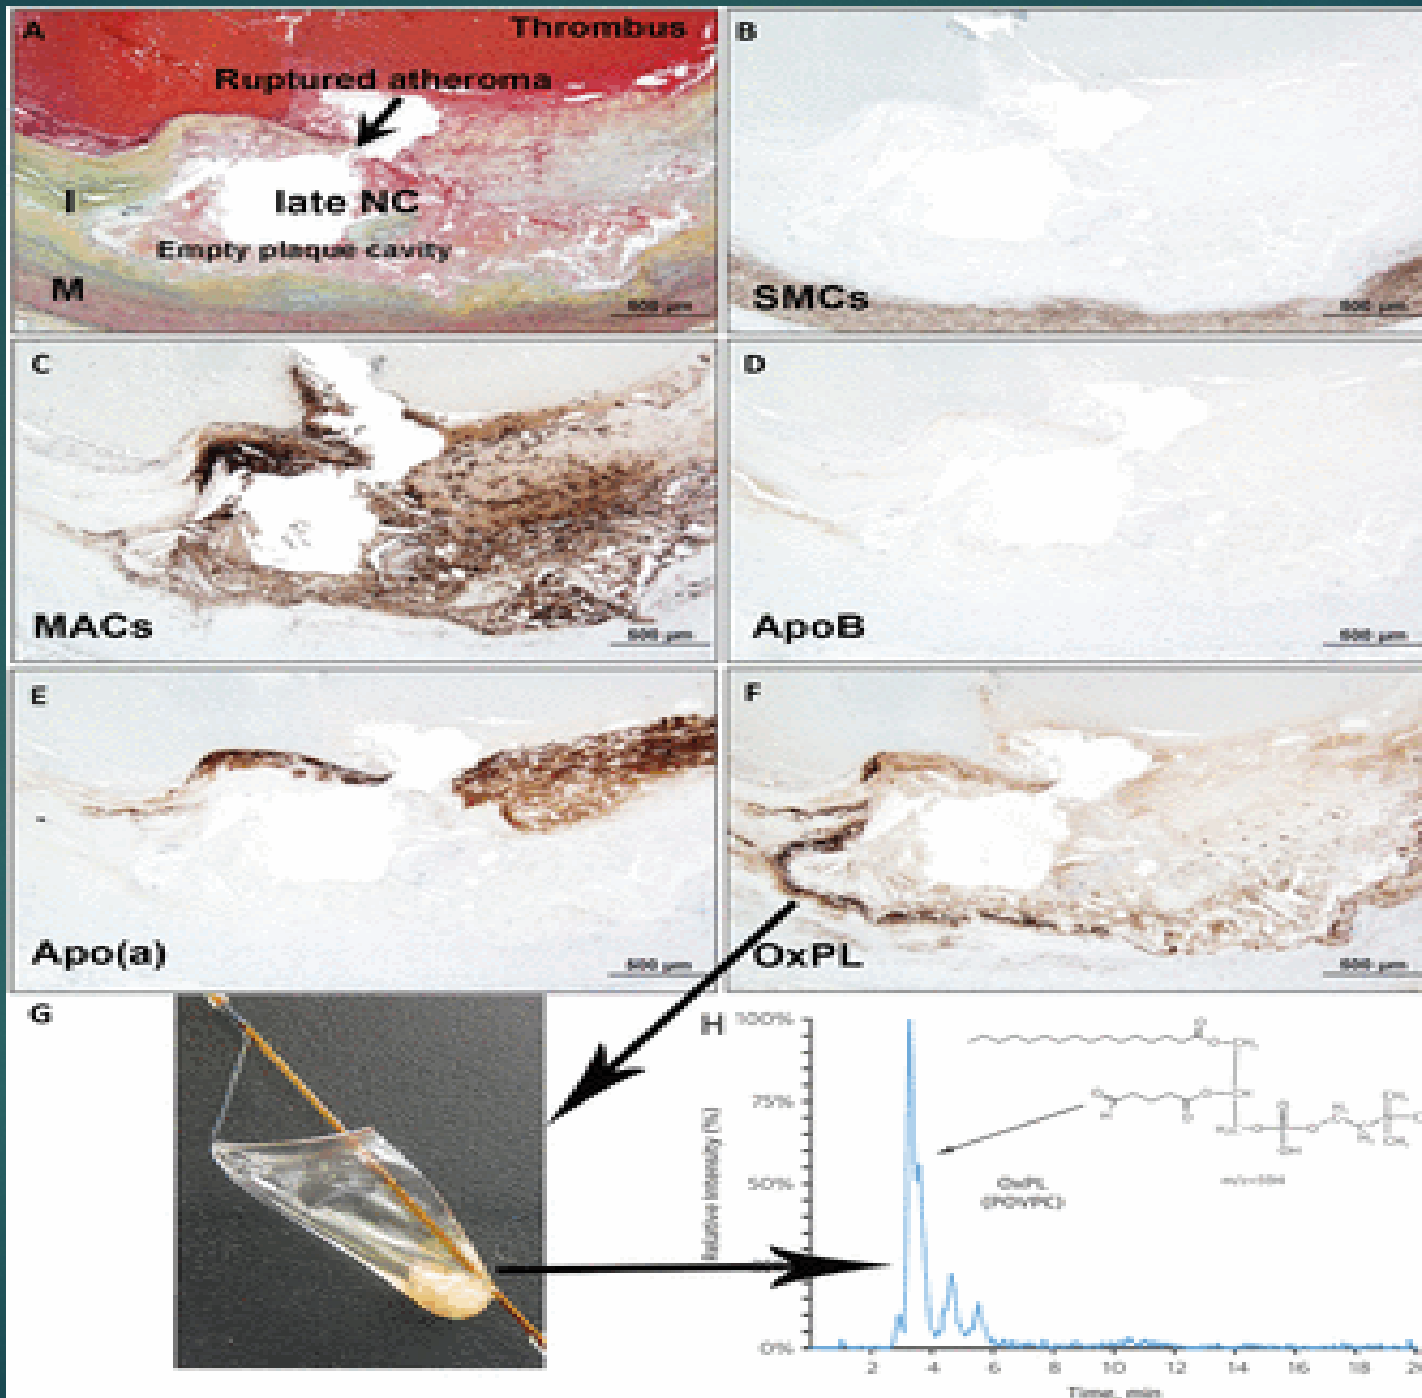

ALP (LDL Pattern B) Why is it *Dangerous*?

1. Rapid **entry** into arterial wall.
2. Low **vitamin E** in lipoproteins.
3. More susceptible to **oxidative** damage.
4. High blood **insulin**.
5. After a **meal**, blood fat level doubles in pattern B versus A.
6. Poor blood vessel **relaxation**.

Lp(a)

- ▶ LDL-like particle where Apo B is covalently bound to Apo (a)
- ▶ Has physiologically evolved from the plasminogen gene
- ▶ Marked heterogeneity in concentration and isoforms
- ▶ Has atherogenic and prothrombotic properties
- ▶ Normal value <30 mg/dL, very high value >60 mg/dL
- ▶ Consider single-lifetime measure of Lp(a) in high risk patients, those with CVD despite controlled LDL, intermediate risk patients with intermediate LDL levels to better reclassify risk
- ▶ No targeted therapy. Statins raise Lp(a) 10-20%
- ▶ Lp(a) may be lowered by PCSK9 inhibitors.

Outline

- ▶ Who should you screen?
- ▶ What tests should you order?
- ▶ **Who should you treat?**
- ▶ Which drugs should you use?
- ▶ What are the controversies?

Four Statin Benefit Groups

2013 ACC/AHA Guidelines for the treatment of Blood Cholesterol to Reduce Atherosclerotic Cardiovascular Risk in Adults

1. Adults aged ≥ 21 years with clinical ASCVD

- ▶ Including hx of or concurrent ACS, MI, stable or unstable angina, coronary or other arterial revascularization, stroke, TIA, or PAD

- ▶ MAJOR RECOMMENDATIONS:

- ▶ **PATIENTS ≤ 75 years, high-intensity statin (or moderate-intensity if safety concern)**
- ▶ **PATIENT > 75 years, moderate-intensity statin**

▶ 2. Adults aged ≥ 21 years with LDL-C ≥ 190 mg/dL

- ▶ Not due to modifiable secondary causes

- ▶ MAJOR RECOMMENDATIONS:

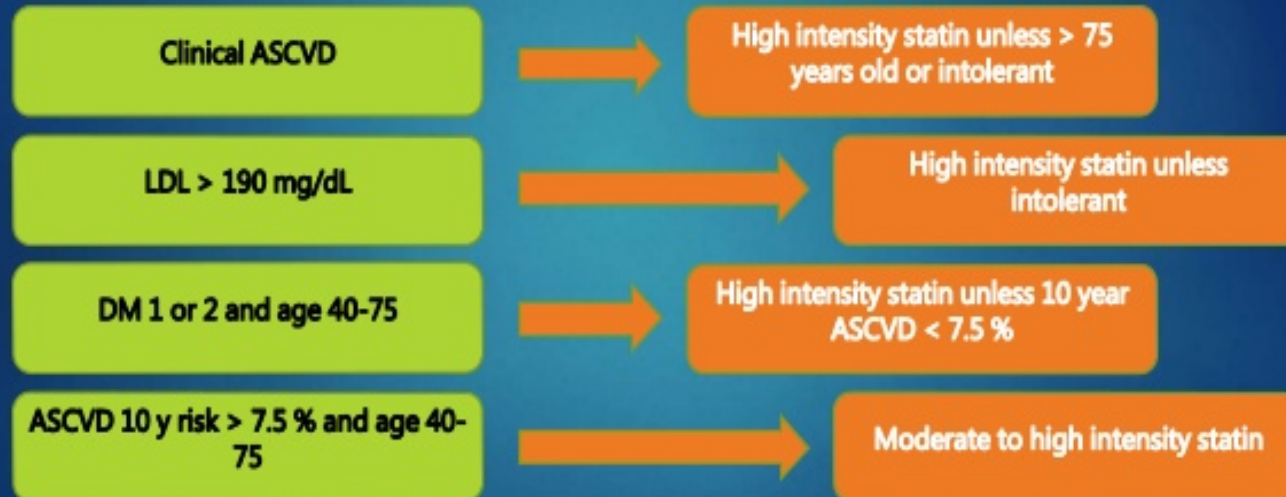

- ▶ **High-intensity statin therapy to achieve a $\geq 50\%$ reduction of LDL-C**
- ▶ **May consider combining statin and non-statin therapy to further reduce LDL-C**
- ▶ **Cascade screening of close biological relatives**

Four Statin Benefit Groups

- ▶ **3. Adults age 40-75 years without ASCVD but with diabetes and with LDL-C 70-189 mg/dL**
 - ▶ MAJOR RECOMMENDATIONS:
 - ▶ **Moderate-intensity statin**
 - ▶ **If 10-year ASCVD risk is $\geq 7.5\%$, consider high-intensity statin**
- ▶ **4. Adults aged 40-75 without ASCVD or diabetes, and with LDL-C 70-189 mg/dL and an estimated 10-year risk for ASCVD of $\geq 7.5\%$**
 - ▶ MAJOR RECOMMENDATIONS:
 - ▶ **If 10-year risk $\geq 7.5\%$, moderate or high-intensity statin**
 - ▶ **If risk ≥ 5 to 7.5% , consider moderate-intensity statin**
 - ▶ **Individualize decision based on presence of high risk factors: LDL >160 , FHx early CAD, hs-CRP >2.0 , CAC >300 , ABI <0.9 , high 10-year risk; and engage pt in risks about benefits, adverse reaction from drug-drug interactions, and pt preferences.**

In a Nutshell

Current Lipid Treatment Guidelines²⁰

Outline

- ▶ Who should you screen?
- ▶ What tests should you order?
- ▶ Who should you treat?
- ▶ **Which drugs should you use?**
- ▶ What are the controversies?

Examples of High, Moderate, and Low Intensity Statin Therapy

High Intensity	Moderate Intensity	Low Intensity
Daily dose lowers LDL-C \geq 50%	Daily dose lowers LDL-C 30- <50%	Daily dose lowers LDL-C < 30%
Atorvastatin 40-80 mg Rosuvastatin 20-40 mg	Atorvastatin 10-20 mg Fluvastatin 40 mg bid Fluvastatin XL 80 mg Lovastatin 40 mg Pitavastatin 2-4 mg Pravastatin 40-80 mg Rosuvastatin 5-10 mg Simvastatin 20-40 mg	Fluvastatin 20-40 mg Lovastatin 20 mg Pitavastatin 1 mg Pravastatin 10-20 mg Simvastatin 10 mg

Bold face indicates statins and doses that were evaluated in RCTs included in the 2013 ACC/AHA guidelines

Non-statin agents

- ▶ Ezetimibe (Zetia)
 - ▶ Reduces cholesterol absorption in small intestine
 - ▶ FDA-approved indications:
 - ▶ As adjunct to diet to ↓ TC, Apo B, LDL-C alone or in combination w/ statin
 - ▶ As adjunct to diet to ↓ TC, Apo B, LDL-C in combination w/ fibrate
 - ▶ Mean % reduction in LDL-C
 - ▶ Monotherapy - 18%
 - ▶ Combination with statin - 25%
 - ▶ CV outcome trial IMPROVE-IT
 - ▶ Considerations: usually well tolerated, increased risk of URI

Non-statin agents

- ▶ **Bile acid sequestrants**

- ▶ Colesevalam (Welchol)
- ▶ Cholestyramine (Questran)
- ▶ Colestipol (Colestid)

- ▶ Effect on LDL-C 15% with monotherapy

- ▶ Considerations: High pill burden, constipation, nausea, ↑TG

- ▶ **Nicotinic acid (Niacin)** - ↓ LDL 5-25%, ↓ TG 20-50%, ↓ Lp(a) 30%, ↑ HDL 15-35%

- ▶ Reduced insulin sensitivity, impaired glucose control in T2DM, ↑ myopathy

- ▶ Neutral CVD outcomes, lack of impact on mortality

- ▶ Recommended for statin intolerant pts who have not reached LDL targets

- ▶ Phytosterols – 5 to 10% decrease in LDL-C

- ▶ Viscous soluble fiber – 5 to 10% reduction in LDL-C

PCSK9 inhibitors

- ▶ Human monoclonal antibody to PCSK9, increases number of LDL receptors, increasing clearance of LDL
 - ▶ Alirocumab (Praluent) - Sanofi
 - ▶ Evolocumab (Repatha) - Amgen
- ▶ FDA-approved indications:
 - ▶ Adjunct to diet and maximally tolerated statin therapy to treat adults with HeFH or clinical ASCVD who need more LDL-C reduction
- ▶ Dosing – Start (75 mg [A], 140 mg [E] SQ every 2 weeks, double dose every 2 weeks up to max dose (300 mg [A], 420 mg [E] once a month.
- ▶ Mean LDL reduction 45-58% alone or in addition to statin
- ▶ Outcomes trials: ODYSSEY, FOURIER
- ▶ Drug-drug interactions: none so far
- ▶ Considerations: Cost, SQ, robust LDL-C reduction, lack of myopathy, nasopharyngitis, long term outcomes lacking, burdensome prior auth

Very novel agents

- ▶ Mipomersen (KYNAMRO)
 - ▶ Antisense human oligonucleotide (ASO) targeted to human Apo B-100 mRNA
 - ▶ Binds by Watson-Crick base pairing and inhibits translation of apo B-100
 - ▶ FDA-approved as an adjunct to other meds in patients with HoFH
 - ▶ Mean LDL-C reduction – 25%
 - ▶ Dose 200 mg SQ QWK
 - ▶ High risk of liver toxicity and even progression to cirrhosis
 - ▶ Only available through FDA REMS program

Very novel agents

- ▶ Lomitapide (Juxtapid)
 - ▶ Interferes with assembly of Apo B lipoproteins in the ER
 - ▶ Approves as adjunct to other strategies for HoFH
 - ▶ Dose: 5 mg po daily, titrate to 60 mg po daily
 - ▶ Mean LDL reduction – additional 40-50% reduction
 - ▶ High risk of liver disease and progression to cirrhosis/steatohepatitis
 - ▶ Inhibits CYP3A4 (grapefruit juice, atorvastatin, OCPs)
 - ▶ Only available through FDA REMS program

LDL apheresis

- ▶ For pts with LDL-C > 500
- ▶ Extracorporeal technique weekly or biweekly
- ▶ Robust LDL changes >50-60%
- ▶ Limited outcome data
- ▶ Considerations - access problems, inconvenient and time consuming, hypotension, hypocalcemia, iron deficiency due to regular phlebotomy, hypocalcemia, need to have a hematology program with interdisciplinary goals

STATINS DOUBLE RISK OF DIABETES

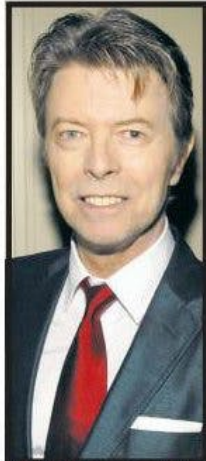

'Alarming' conclusion of 10-year research into controversial heart drug

EXCLUSIVE By Lucy Johnston

PATIENTS taking the controversial heart drug statins have almost doubled the risk of developing diabetes, a shock study has found.

The "alarms" research also found people using the drugs have become more than twice as likely to develop the most serious diabetic complications, including eye, nerve

...to Shakespeare

To Statin
or
Not To Statin

Do the benefits *really* outweigh the side effects?

The drugs saved no lives, but they did help prevent nonfatal heart attacks in 1.6 percent of this group. That's not nothing, but it's got to be weighed against the 10 percent who developed muscle problems caused by side effects from the drugs and the 1.5 percent who developed statin-driven type 2 diabetes.

EraseDisease.com

Are we over-prescribing these meds?

Statins and Diabetes

I'm lovin' it

**Big Mac with
Mc Statins please.**

Mc Statins: There's still some hope left.

The advertisement features a white background with a faint chemical structure of a statin molecule overlaid on the text. The McDonald's logo is in the top left corner, and the slogan 'I'm lovin' it' is below it. The main headline is in a large, bold, dark red font. To the right of the text is a close-up image of a Big Mac burger. At the bottom left, there is a small line of text: 'Mc Statins: There's still some hope left.'

Are we being influenced by Pharma?

"Drs. Smith and Thompson noted that the new cardiac balloon catheter featured a microscopic statin advertisement."

The Statin Disaster: Biggest Fraud in Medical History

DON'T BELIEVE THE HYPE!

Your body *needs* cholesterol for brain function and healthy hormone production. **Your body's enemy is chronic inflammation.** Cholesterol is used by every cell in your body. Statin drugs aren't the answer. Get the facts.

LDL-C Lowering with Ezetimibe vs Alirocumab

Achieved LDL-C Over Time on Background of Maximally-Tolerated Statin

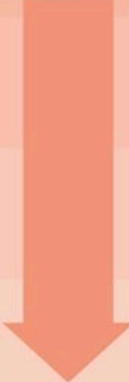

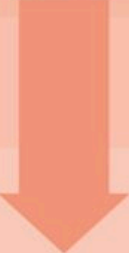

Patient at ASCVD risk on maximum statin therapy

LDL-C thresholds for considering additional LDL-C lowering treatment with:

 PCSK9 mAb
for ~50% LDL-C reduction

or

 Ezetimibe
for ~20% LDL-C reduction

Patient LDL-C (mg/dl)	 Very high-risk patient (≥30 10-year ASCVD risk)	 High-risk (20-29% 10-year ASCVD risk)	 Moderate-risk (10-19% 10-year ASCVD risk)
≥190	 PCSK9 mAb (NNT ≤21-28)  Ezetimibe (NNT <30)	 PCSK9 mAb (NNT ≤21-28)  Ezetimibe (NNT <50)	 PCSK9 mAb (NNT <50)
≥160			
≥130			
≥100		 PCSK9 mAb (NNT <50)	
≥70	 PCSK9 mAb (NNT <50)		

Evolving Paradigms for CVD Prevention

Individual's Potential for Net Benefit

Some closing thoughts..

- ▶ Statins are the only class of drugs with substantial mortality and morbidity benefits.
- ▶ Ezetemibe and PCSK9 inhibitors have single RCT data to show mortality benefit
- ▶ No mortality benefit for niacin or fibrates
- ▶ 2013 guidelines
 - ▶ Shift away from LDL-lowering targets and focus on treatment groups with known benefit and statin dose classes with highest impact
- ▶ **We must customize the drug to the patient, and do a multivariate analysis for every patient incorporating patient risk factors, lab data, genomics, cost, benefit vs risk, to come up with a comprehensive model tailored for each patient.**

Thank You!
