

Methodist Hospital of Sacramento 2016 Community Health Needs Assessment

Acknowledgements

This report was prepared by Valley Vision on behalf of Methodist Hospital of Sacramento and the Sacramento Region Community Health Needs Assessment (CHNA) Collaborative. Through the course of the CHNA project, many organizations and individuals contributed input on the health issues and conditions impacting their communities or the communities they serve. We gratefully acknowledge the contributions of these participants, many of whom shared deeply personal challenges and experiences with us. We hope that the contents of this report serve to accurately represent their voices.

EXECUTIVE SUMMARY

Community Health Needs Assessment (CHNA) Background/Purpose Statement

The purpose of this community health needs assessment (CHNA) is to identify and prioritize significant health needs of the community served by Methodist Hospital of Sacramento. The priorities identified in this report help to guide the hospital's community health improvement programs and community benefit activities, as well as its collaborative efforts with other organizations that share a mission to improve health. This CHNA report meets requirements of the Patient Protection and Affordable Care Act and California Senate Bill 697 that not-for-profit hospitals conduct a community health needs assessment at least once every three years.

This report documents the processes, methods, and findings of the CHNA conducted in partnership with Methodist Hospital of Sacramento, located at 7500 Hospital Drive in Sacramento, California. Building on federal and state requirements, the objective of the 2016 CHNA was:

To identify and prioritize community health needs and identify resources available to address those health needs, with the goal of improving the health status of the community at large and for specific locations and/or populations experiencing health disparities.

Community Definition

The community or hospital service area (HSA) is defined as the geographic area (by ZIP code) in which the hospital receives its top 80% of discharges.

Assessment Process and Methods

The CHNA was completed as a collaboration of the four major health systems in the Greater Sacramento region: Dignity Health, Kaiser Permanente, Sutter Health and UC Davis Health System. Together, the CHNA Collaborative represented 15 hospitals in the Sacramento Region. The CHNA Collaborative project was conducted over a period of eighteen months, beginning in January 2015 and concluding in June 2016.

The following research questions were used to guide the 2016 CHNA:

- 1. What is the community or hospital service area (HSA) served by each hospital in the CHNA Collaborative?
- **2.** What specific geographic locations within the community are experiencing social inequities that may result in health disparities?
- **3.** What is the health status of the community at large as well as of particular locations or populations experiencing health disparities?
- **4.** What factors are driving the health of the community?
- **5.** What are the significant and prioritized health needs of the community and requisites for the improvement or maintenance of health status?
- **6.** What are the potential resources available in the community to address the significant health needs?

To meet the project objectives, a defined set of data collection and analytic stages were developed. Data collected and analyzed included both primary or qualitative data, and secondary or quantitative data. To determine geographic locations affected by social inequities, data were compiled and analyzed at the census tract and ZIP code levels as well as mapped by GIS systems. From this analysis as well as an initial preview of the primary data, Focus Communities were identified within the HSA. These were defined as geographic areas (ZIP codes) within the HSA that had the greatest concentration of social inequities that may result in poor health outcomes. Focus Communities were important to the overall

CHNA methodology because they allowed for a place-based lens with which to consider health disparities in the HSA.

To assess overall health status and disparities in health outcomes, indicators were developed from a variety of secondary data sources (see Appendix B). These "downstream" health outcome indicators included measures of both mortality and morbidity such as mortality rates, emergency department visit and hospitalization rates. They also included risk behaviors such as smoking, poor nutrition and physical activity. Health drivers/conditions or "upstream" health indicators included measures of living conditions spanning the physical environment, social environment, economic and work environment, and service environment. This also included the indicators on social inequities that were used for the determination of Focus Communities. Overall, more than 170 indicators were included in the CHNA.

Community input and primary data on health needs were obtained via interviews with service providers and community key informants and through focus groups with medically underserved, low-income, and minority populations. Transcripts and notes from interviews and focus groups were analyzed to look for themes and to determine if a health need was identified as significant and/or a priority to address. Primary data for Methodist Hospital included 26 key informant interviews with 37 participants and 15 focus groups conducted with 153 participants including community members and service providers. A complete list of key informant interview data sources is available in Appendix F and a complete list of focus group data is available in Appendix G.

Process and Criteria to Identify and Prioritize Significant Health Needs

In order to identify and prioritize the significant health needs, the quantitative and qualitative data were synthesized and analyzed according to established criteria outlined later in this report. This included identifying eight potential health need categories based upon the needs identified in the 2013CHNA, the grouping of indicators in the Kaiser Permanente Community Commons Data Platform (CCDP), and a preliminary review of primary data. Indicators within these categories were flagged if they compared unfavorably to state benchmarks or demonstrated racial/ethnic disparities according to a set of established criteria. Eight potential health needs were validated as significant health needs for the service area. The data supporting the identified significant health needs can be found in the Prioritized Description of Significant Health Needs section of this report. The resources available to address the significant health needs were compiled by using the resources listed in the 2013 CHNA reports as a foundation, and then verifying and expanding these resources to include those referenced through community input. Additional information regarding resources is found below in the Resources section, and a comprehensive list of potential resources to address health needs is located in Appendix H.

List of Prioritized Significant Health Needs

The following is a list of eight significant health needs for the Methodist HSA in prioritized order:

1. Active Living and Healthy Eating

This category includes all components of healthy eating and active living including health behaviors (e.g. fruit and vegetable consumption), associated health outcomes (e.g. diabetes) and aspects of the physical environment/living conditions (e.g. food deserts). The category does <u>not</u> include food security, which is a component of the Basic Needs category.

2. Access to Behavioral Health Services

This category encompasses access to mental health and substance abuse prevention and treatment services, including tobacco education, prevention and cessation services, mental health services, social engagement opportunities for youth and seniors, and suicide prevention. This category also includes

health behaviors (e.g. substance abuse), associated health outcomes (e.g. COPD) and aspects of the social and physical environment (e.g. social support and access to liquor stores).

3. Access to High Quality Health Care and Services

This category encompasses access to primary and specialty care, dental care and maternal and infant care. Additionally, this category includes health education and literacy, continuity of care, care coordination and patient navigation including linguistically and culturally competent services. This category also includes health behaviors that are associated with access to care (e.g. cancer screening), health outcomes that are associated with access to care/lack of access to care (e.g. low birth weight) and aspects of the service environment (e.g. health professional shortage area). The category does <u>not</u> include access to mental health providers, which is a component of the Access to Behavioral Health Services category.

4. Disease Prevention, Management and Treatment

This category encompasses health outcomes that require disease prevention and/or management and treatment including: cancer (breast, cervical, colorectal, lung and prostate), cardiovascular disease/stroke (heart disease, hypertension and renal disease) and HIV/AIDS/STDs (chlamydia and gonorrhea) and asthma. This category also includes health behaviors that are associated with chronic and communicable disease (e.g., fruit/vegetable consumption, screening), health outcomes that are associated with these diseases or conditions (e.g. overweight/obesity), and associated aspects of the physical environment (e.g. food deserts).

5. Basic Needs (Food Security, Housing, Economic Security, Education)

This category encompasses economic security (income, employment and benefits), food security/insecurity, housing (affordable housing, substandard housing), education (reading proficiency, high school graduation rates) and homelessness.

6. Safe, Crime and Violence Free Communities

This category includes safety from violence and crime including violent crime, property crimes and domestic violence. This category includes health behaviors (e.g. assault), associated health outcomes (e.g. mortality - homicide) and aspects of the physical environment (e.g. access to liquor stores). In addition, this category includes factors associated with unsafe communities such as substance abuse and lack of physical activity opportunities, and unintentional injury such as motor vehicle accidents.

7. Affordable and Accessible Transportation

This category includes the need for public or personal transportation options, transportation to health services and options for persons with disabilities.

8. Pollution-Free Living and Work Environments

This category includes measures of pollution such as air and water pollution levels. This category includes health behaviors associated with pollution in communities (e.g. physical inactivity), associated health outcomes (e.g. COPD) and aspects of the physical environment (e.g. road network density). In addition, this category includes tobacco usage as a pollutant. The category does <u>not</u> include climate related factors such as drought and heat stress.

Resources Available

An extensive process was used to identify the resources available to address the significant health needs and catalog them for inclusion in the final CHNA report. First, all resources identified in the 2013 CHNA report were included for consideration in a working comprehensive list of resources. Secondly, qualitative data from key informant interviews and focus groups were analyzed to include the resources identified by community input. Resources from community input were added to the list and all resources were then verified to assure that they were current and actively available. Once all resources on the list had been confirmed, each resource was considered in relation to the significant health needs for the HSA. As accurately as possible, each resource was assessed to determine which of the health needs it most closely addressed.

Through this process, 158 resources were identified pertaining to the significant health needs for Methodist Hospital of Sacramento, located at located at 7500 Hospital Drive in Sacramento, California. The final list of health resources is available in Appendix H.

Report Adoption, Availability, and Comments

The Sacramento Service Area Hospital Community Board voted, approved, and adopted the Community health Needs Assessment for Methodist Hospital of Sacramento on June 23, 2016.

This report is widely available to the public on the hospital's web site, and a paper copy is available for inspection upon request at Dignity Health, Community Health and Outreach Department, 3400 Data Drive, Rancho Cordova, CA 95670.

Written comments on this report can be submitted by email to DignityHealthGSSA_CHNA@dignityhealth.org

ASSESSMENT PURPOSE AND ORGANIZATIONAL COMMITMENT

Purpose for the Community Health Needs Assessment (CHNA)

The purpose of this Community Health Needs Assessment (CHNA) is to identify and prioritize significant health needs of the community served by Methodist Hospital of Sacramento. The priorities identified in this report help to guide the hospital's community health improvement programs and community benefit activities, as well as its collaborative efforts with other organizations that share a mission to improve health. This CHNA report meets requirements of the Patient Protection and Affordable Care Act and California Senate Bill 697 that not-for-profit hospitals conduct a community health needs assessment at least once every three years.

This report documents the processes, methods, and findings of the CHNA conducted in partnership with Methodist Hospital of Sacramento, located at 7500 Hospital Drive in Sacramento, California. Building on federal and state requirements, the objective of the 2016 CHNA was:

To identify and prioritize community health needs and identify resources available to address those health needs, with the goal of improving the health status of the community at large and for specific locations and/or populations experiencing health disparities.

Organizational Commitment

Rooted in Dignity Health's mission, vision and values, Methodist Hospital of Sacramento is dedicated to delivering community benefit with the engagement of its management team, Community Board and Community Benefit Advisory Committee. The board and committee are composed of community members who provide stewardship and direction for the hospital as a community resource.

The development of community health improvement strategies to address priority health issues is a collaborative effort engaging members of a dedicated Community Health and Outreach Department who work directly with the hospital president, management and clinical staff, the hospital's Community Board and Community Benefit Advisory Committee (a standing committee of the board), as well as community partners. The department is responsible for implementing, managing and evaluating initiatives, and oversees community benefit reporting and the development of the hospital's Community Health Needs Assessment. Meetings are held bimonthly with the Community Benefit Advisory Committee, which provides strategic direction, guidance and oversight for the hospital's community benefit practices. Committee reports are provided bimonthly to the Community Board. Primary committee roles are to ensure hospital initiatives and services are aligned with priority health issues identified in the CHNA, represent the needs of the community and monitor the progress of initiatives. Both the Community Board and the Community Benefit Advisory Committee review and approve the CHNA and the Community Benefit plan (see Appendix A for rosters of the Methodist Hospital of Sacramento Community Board and Community Benefit Advisory Committee).

Methodist Hospital of Sacramento's community benefit program includes financial assistance provided to those who are unable to pay the cost of their care, unreimbursed costs of Medicaid, subsidized health services that meet a community need, community health improvement services and health professions education. Our community benefit also includes monetary grants provided to not-for-profit organizations that are working together to address significant health needs identified in the CHNA. Many of these programs and initiatives are described in this report.

In addition, the hospital is investing in community capacity to improve health – including addressing the social determinants of health – through Dignity Health's Community Investment Program. Dignity Health

investments support nonprofit organizations that deliver an array of services to low-income communities in the Sacramento region.

Dignity Health Mission Statement:

We are committed to furthering the healing ministry of Jesus. We dedicate our resources to:

- Delivering compassionate, high-quality, affordable health services;
- Serving and advocating for our sisters and brothers who are poor and disenfranchised; and
- Partnering with others in the community to improve the quality of life.

Dignity Health Values:

Dignity Health is committed to providing high-quality, affordable healthcare to the communities we serve. Above all else we value:

Dignity - Respecting the inherent value and worth of each person.

Collaboration - Working together with people who support common values and vision to achieve shared goals.

Justice - Advocating for social change and acting in ways that promote respect for all persons.

Stewardship - Cultivating the resources entrusted to us to promote healing and wholeness.

Excellence - Exceeding expectations through teamwork and innovation.

Organization of the Report

The remainder of this report is organized in accordance with recommended/required components detailed from the other collaborative health system partners. The report continues with a description of the Methodist hospital service area (HSA), including a description of geographical areas of the HSA where low income, underserved, and diverse populations reside. The report then details the CHNA process and methods, including both the process model used for the CHNA and the theoretical model used in the assessment for determination of quantitative indicators to be included. Primary data collection methods, participant demographics and methods are also detailed. Assessment findings are provided in accordance with the theoretical model used for the Methodist Hospital CHNA in the following categories: morbidity and mortality, risk behaviors, and living conditions. A detailed description of the prioritized significant health needs is provided with the corresponding secondary indicators and qualitative findings, followed by a summary of available resources, impact report of actions taken since the 2013 CHNA, a conclusion, and corresponding appendices.

DEFINITION OF COMMUNITY SERVED

Community Definition

The community or hospital service area (HSA) is defined as the geographic area (by ZIP code) in which the hospital receives its top 80% of discharges. Figure 1 shows the Methodist HSA.

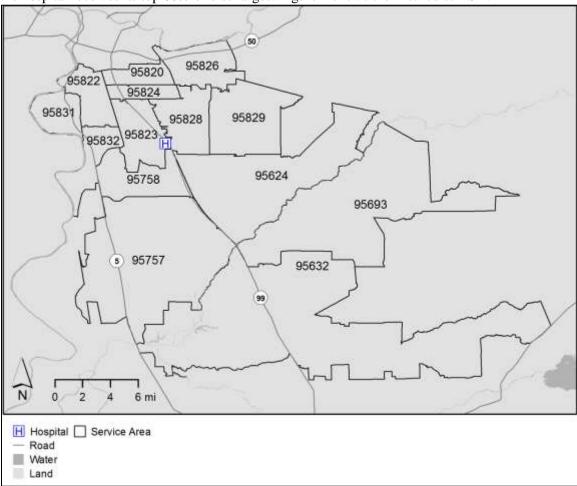

Figure 1: Methodist Hospital of Sacramento Service Area

Demographics of the Hospital Service Area (HSA)

The Methodist Hospital of Sacramento HSA is located in Northern California and includes more than 500,000 residents. As Tables 1 and 2 show, the area is considerably diverse in population, economic stability (income and poverty), and insurance status. Table 1 shows the total population count for the HSA, the median age of the HSA, and the median income compared to the state benchmarks. Table 2 provides information on the presence of medically underserved, low income, and minority residents in the HSA.

Population Characteristics

Table 1: Census Population Counts, Range of Median Age and Median Income for the Methodist HSA,

Compared to the County and State

ZIP Code	Population	Median Age	Median Income
95624	62335	34.6	\$77,652
95632	29892	34.5	\$59,731

Methodist HSA	559,311	Range: 26.2 years (95832) to 48.3 years (95693)	Range: \$37,931 (95823) to \$84,297 (95757)
Sacramento County	1,435,207	35.1 years	\$55,064
CA State	37,659,181	35.4 years	\$61,094

Source: Census, 2013

The population of the Methodist HSA makes up approximately 1.5% of all residents in the State of California. The majority of the population count for the HSA comes from residents living in Sacramento County. Population counts at the ZIP code level varied from 5,640 residents in ZIP code 95693 (Wilton) to 74,154 residents in ZIP code 95823 (Fruitridge). The median age of Sacramento County is similar to the median age of the state, which makes up the majority of the HSA area. The median age at the ZIP code level ranged from 26.2 years in 95832 (Lower Meadowview) to 48.3 years in 95693 (Wilton). The median income by ZIP code for the HSA ranged significantly from approximately \$38,000 in 95823 (Fruitridge) to over \$84,000 in 95757 (Elk Grove), a range of over \$46,000 dollars a year.

In an attempt to understand the extent of and location of the medically underserved, low income and minority populations living in the Methodist HSA, specific indicators were examined. Table 2 below describes these indicators for the HSA.

Table 2: Percent Living Below 100% Federal Poverty Level, Percent Uninsured and Percent Minority for

ZIP Codes in the Methodist HSA Compared to the County and State

Percent Below Federal Percent					
ZID C. J.	Poverty Level	Percent	Minority

Source: Census, 2013

The percent of population living in poverty for the Methodist HSA was greater than both the Sacramento County and state benchmarks. The Methodist HSA ZIP code with the highest percent of population in poverty was 95824 (Parkway) at 36.7%, compared to the lowest percent poverty in ZIP code 95831 (Pocket) at 7.1%. The percent of uninsured residents was lower in the Methodist HSA relative to the state benchmark, though slightly above the Sacramento County benchmark. The ZIP code with the highest percent uninsured was 95824 (Parkway) at 24.7%, and the lowest percent was 7.4% in ZIP code 95757 (Elk Grove). The Methodist HSA percent of minority residents was 68.0%, notably higher than Sacramento County at 52.1% and the state at 60.3%. Examination of areas throughout the county revealed a large variation in the degree of diversity, or percent minority. ZIP code 95832 (Lower Meadowview) showed a high degree of diversity, with the percent of minority populations at 80.2%. This percent is drastically different from ZIP code 95693 (Wilton), which had the lowest percent of minority residents at 29.8%.

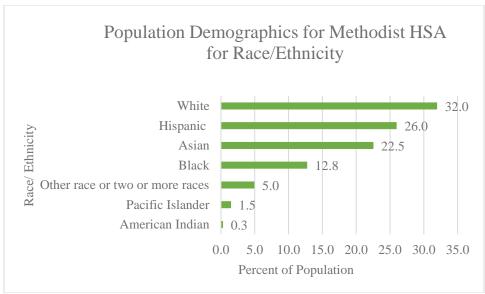

Figure 2: Population Demographics for Methodist HSA for Race/Ethnicity

Figure 2 shows the population demographics for the Methodist HSA. Census data showed that Whites make up the highest percent of residents in the HSA, followed by Hispanics, Asians and Blacks.

Community Health Vulnerability Index and Focus Communities

To further examine medically underserved, low income and diverse populations in the Methodist HSA, two tools were developed. This assessment used a Community Health Vulnerability Index (CHVI) to help identify census tracts within ZIP codes in the HSA where such populations may reside geographically. Also, Focus Communities at the ZIP code level were determined to provide a place-based lens with which to consider health disparities in the HSA. Both the CHVI and the Focus Communities are described in the following passages.

Community Health Vulnerability Index – Overview

The CHVI assisted in the identification of geographical areas in the HSA ZIP codes that may experience health disparities using socio-economic drivers of poor health outcomes. The CHVI is based on the Community Need Index (CNI), created and made publically available by Dignity Health and Truven Health Analytics (for further description of the CNI, see Appendix B). The CHVI was also used to help focus primary data collection and in the further determination of Focus Communities, which is discussed next. The indicators used to create the CHVI were collected at the census tract level and are presented in Table 3 and detailed in Appendix C, Detailed Analytic Methodology including SHN Categorization. The CHVI results for the Methodist HSA are presented in Figure 3.

Table 3: Indicators Included in the CHVI

Percent Minority (Hispanic or Non-White)	Percent Families with Children in Poverty
Population 5 Years or Older who Speak Limited	Percent Households 65 Years or Older in Poverty
English	
Percent 25 or Older Without a High School	Percent Single Female-Headed Households in
Diploma	Poverty
Percent Unemployed	Percent Renter-Occupied Housing Units
Percent Uninsured	· ·

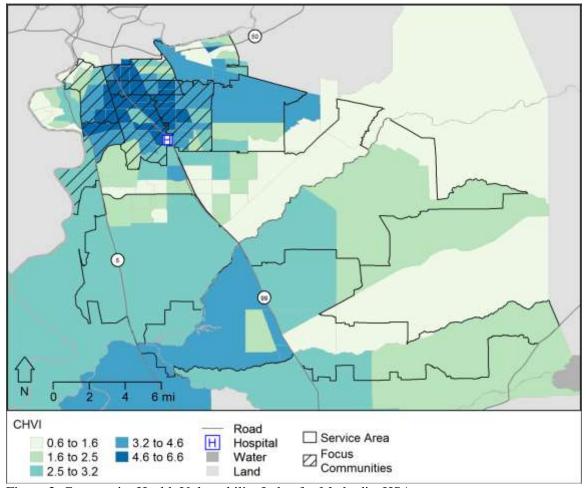

Figure 3: Community Health Vulnerability Index for Methodist HSA

Focus Communities – Overview

Focus Communities were used to provide a place-based lens with which to consider health disparities in the HSA. The Focus Communities were defined using four components: 1) preliminary analysis of indicators of social determinants of health and inequities (e.g., poverty and educational attainment) at the ZIP code level, 2) census tract values from the CHVI, 3) initial input from area wide service providers and 4) consideration of ZIP codes that were identified as Focus Communities in the Methodist 2013 CHNA (previously referred to as Communities of Concern). These inputs provided a unique perspective on social determinants within the Methodist HSA and were considered both separately and collectively when selecting Focus Communities.

The social inequities dataset included 22 indicators (presented in Table 4) that were analyzed at the ZIP code level to identify and flag the top 20% of ZIP codes with the highest rates of social inequities compared to county and state benchmarks. For the CHVI, ZIP codes were flagged if they intersected a census tract in which the CHVI value fell within the top 20% of the HSA, values 3.9 to 6.0. In addition to quantitative measures, Focus Communities were further verified through analysis of input from initial service area wide key informant interviews. Input on vulnerable locations within the HSA was considered from interviews with public health experts and area service providers. Locations identified as vulnerable were then cross-referenced with the ZIP codes that were flagged in the CHVI and social inequities data, as well as with ZIP codes that were identified as Focus Communities in 2013. This was included to allow greater continuity between CHNA round and to reflect the work of the hospitals oriented to serve these disadvantaged communities.

Table 4: Social Inequities Indicators to Determine Focus Communities

Median income	Percent non-White or Hispanic population
GINNI coefficient (measure of income inequality)	Foreign born population
Population in poverty (under 100% Federal Poverty Level)	Citizenship status
Percent with public assistance	Population 5 Years or older who speak limited English
Percent households 65 years or older in poverty	Single female headed households
Percent families with children in poverty	Percent homeowners with housing expenses greater than 30% of income (homes with mortgages)
Percent single female headed households in poverty	Percent homeowners with housing expenses greater than 30% of income (homes without mortgages)
Percent unemployed	Percent renters with housing expenses greater than 30% of income
Uninsured population	Population over 18 that are civilian veterans
Population with public insurance	Percent renter occupied housing units
Population with any disability	Percent population 25 or older without a high school diploma

The Focus Communities for Methodist are found in Figure 4 and listed in Table 5. Figure 4 displays six Focus Community ZIP codes, denoted in red. The specific ZIP codes and area names are provided in Table 5, with the census population for each.

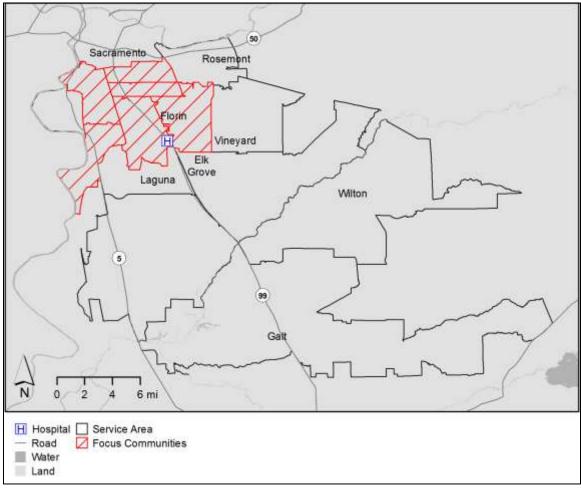

Figure 4: Focus Communities for the Methodist HSA

Table 5: Six Identified Focus Communities for the Methodist HSA

ZIP Code	Community/Area*	Population
95820	Tahoe Park	33,967
95822	Executive Airport/Meadowview	43,024
95823	Fruitridge	74,154
95824	Parkway	29,344
95828	Florin	60,993
95832	Lower Meadowview	12,051
Total Population in the Focus Communities		253,533
Total Population i	559,311	
Percent of the HS	A in the Focus Communities	45.3%

Source: Census, 2013

Primary data collected in this assessment confirmed the location of vulnerable populations in the Methodist HSA that were identified in the previously mentioned Focus Communities. During primary data collection, key informants and community members were asked to identify geographical areas and populations in the HSA that were experiencing health inequities. Their responses indicated that specific geographic areas like Tahoe Park, Executive Airport/Meadowview, Fruitridge, Parkway, Florin and Lower Meadowview were areas of concern. In terms of population groups, data indicated that Latino/Hispanics, Blacks, Asians (Hmong, Filipino, Chinese, South Eastern, Vietnamese, Cantonese, Pacific Islanders), Whites, Syrian Refugees, Russians, Ukrainians, Slavic, East Indians (Punjabi), Native Americans and Middle Eastern Refugee (Arab), were among the most mentioned as populations in need of improved health. A major determination for the above mentioned groups was directly related to the absence or presence of poverty in these populations. Poverty appeared to be the biggest influence in determining vulnerability to poor health, a finding detailed later in this report.

ASSESSMENT PROCESSES AND METHODS

Process Overview

Sacramento Region Collaborative Process Model

The CHNA collaborative project was conducted over a period of 18 months, beginning in January 2015 and concluding in June 2016. The project was conducted using a series of data collection and analytical phases. The CHNA process began with the collection and analysis of secondary data indicators of social inequities and proceeded with collection of both "upstream" and "downstream" health indicators. Primary data collection began with interviews of area health experts such as public health and social service representatives. The first stage of data analysis resulted in the identification of vulnerable communities (e.g., low-income, medically underserved and minority populations), which then guided further primary data collection including community member focus groups. These data were considered together with the data in the Community Commons Data Platform (CCDP) to develop potential health need categories that provided an organizational structure to integrate these numerous inputs, analyze the data and identify the significant health needs for the HSA. The significant health needs were then prioritized using established criteria and resources available to address the identified needs and were compiled for the final report. The overall process to conduct the CHNAs is depicted in the CHNA Process Model (Figure 5).

^{*} ZIP code and community area name is approximate here and throughout the report.

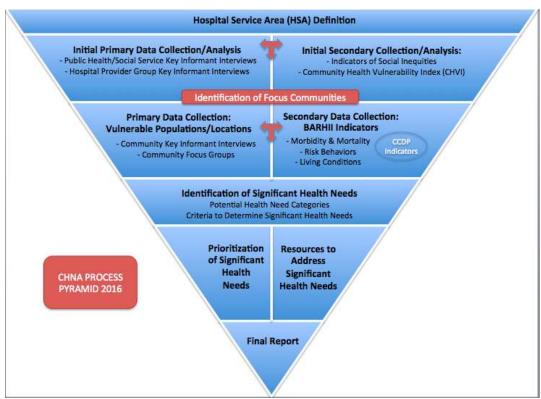

Figure 5: CHNA Process Model

BARHII Model

Quantitative indicators used in this assessment were guided by a conceptual framework developed by the Bay Area Regional Health Inequities Initiative (BARHII) (Figure 6). The BARHII Framework demonstrates the connection between social inequalities and health and focuses attention on measures that had not characteristically been within the scope of public health departments. Valley Vision used the BARHII framework to organize quantitative indicators, as well as frame the primary data collection tool, to capture both "upstream" and "downstream" factors influencing health in the HSA. The BARHII framework was also used in the organization of this report beginning in the "Findings" section of the report. The findings are presented in the report starting with "downstream factors" like mortality and morbidity, followed by risk behaviors and living conditions. Social inequities data is spread throughout the body of the report.

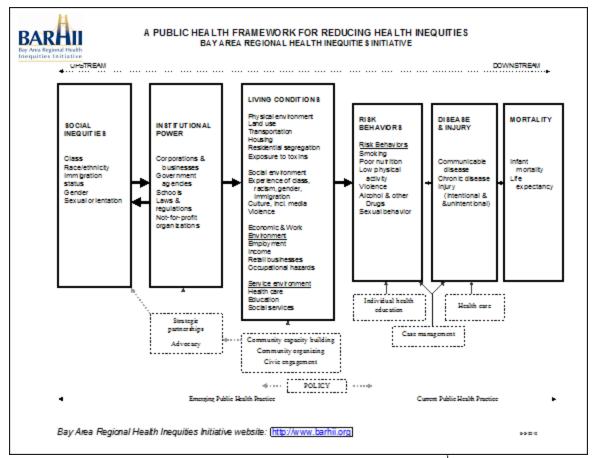

Figure 6: Bay Area Regional Health Inequities Initiative (BARHII) Model¹

Secondary Data Collection – Processing and Analyzing

Data Collection: Overview

This section serves to provide a brief overview of the secondary data collection, processing and analysis approaches used to support the CHNA. For additional detail, including detailed project methodology, please refer to Appendices B and C.

The secondary data supporting the CHNA was collected from a variety of sources, and was processed in multiple stages before it was used for analysis. The selection of secondary data indicators was guided by the BARHII Framework previously illustrated in Figure 6. Specific secondary data indicators were selected to represent the concepts organized in the six categories in the BARHII model that reflect both "upstream" and "downstream" factors influencing health. A number of general principles guided the selection of secondary data indicators to represent these concepts. First, only indicators associated with concepts in the BARHII framework were included in the analysis. Second, indicators available at a subcounty level (such as at a ZIP code or smaller level) were preferred for their utility in revealing variations within the HSA. Finally, indicators were only collected from data sources deemed reliable and reputable, with a preference for indicators that were more current than those used in the 2013 CHNA report.

¹ Bay Area Health Inequities Initiative (BARHII). BARHII Framework. Available at: http://barhii.org/framework/. Accessed Jan 20, 2016.

Mortality data were primarily obtained from CDPH and morbidity data were primarily obtained from OSHPD. These input data were processed using methods described in detail in Appendix B to result in a set of indicators for risk behaviors, disease/injury, and mortality. Input CDPH data were used to develop mortality rates and broader measures of health status for each ZIP code in the HSA. Input OSHPD data were used to develop hospitalization (H) and emergency department (ED) discharge rates for each ZIP code in the HSA. The majority of indicators pertaining to living conditions and other "upstream" factors in the report were obtained from the US Census Bureau. These indicators primarily focus on the sociodemographic characteristics of the population within the HSA, and are also listed in Appendix B. Health outcome and health behaviors were also collected from the CCDP to compliment the indicators already collected from additional sources. Indicators in the CCDP platform were only selected for final analysis and inclusion if they did not duplicate indicators that were pulled from other sources. A detailed list of indicators collected for the 2016 CHNA is in Appendix B, Secondary Data Dictionary and Processing.

The secondary data was processed in multiple stages before it was analyzed. The three basic processing steps include rate smoothing, age-adjustment, and obtaining benchmark rates. A detailed description of this process is outlined in Appendix B, Secondary Data Dictionary and Processing.

Primary Data Collection

Overview of Primary Data Collection

Community input was provided by a broad range of community members through the use of key informant interviews and focus groups. Individuals with the knowledge, information, and expertise relevant to the health needs of the community were consulted. These individuals included representatives from the local public health department as well as leaders, representatives, and members of medically underserved, low-income, and minority populations. When applicable, other individuals with expertise on local health needs were consulted. For a complete list of individuals who provided input, see Appendices F and G.

Methodology for Collection and Interpretation

Primary data were collected from May 2015-November 2015. Instruments used in primary data collection included a participant informed consent, a demographic questionnaire, the interview question guide and a project summary sheet. All participants were given an informed consent form prior to their participation that provided information about the project, asked for permission to record the interview, and listed the potential benefits and risks for involvement in the interview (Appendix D). Participants were also asked to complete a voluntary questionnaire that was used to compile the demographics on all key informant and focus group participants (Appendix E). The same interview guide was used for key informant interviews and community focus groups with slight modifications for focus groups conducted in Spanish and focus groups with youth or low-literacy populations. In brief, the guide prompted participants to share: (1) the quality of life in their communities; (2) the health issues they see and experience in their communities; (3) the most urgent or priority health needs of their communities; and (4) the resources available to help address health needs (see Appendix E for full interview guide). A project summary sheet (Appendix E) was also given to all participants to provide them with information about the project as well as contact information for the CHNA staff leading the interviews.

Key Informant Interviews

Key informant interviews were conducted with area health experts and service providers familiar with health issues and places and populations experiencing health disparities within the HSA. Primary data collection began with group key informant interviews of hospital service providers including nursing managers, medical directors, social workers, case managers, patient coordinators/navigators, Emergency Department providers, and administrative leadership. Early interviews were also conducted with county Public Health Officers and other public health and social service experts of the corresponding county within the HSA. Input from the initial set of group key informant and service provider interviews solicited expert opinion on vulnerable locations and populations within the HSA. This information was used to conduct additional key informant interviews with service providers in low-income, medically underserved and minority communities.

A total of 26 key informant interviews were completed for the Methodist HSA with 37 service providers, which are listed in Appendix F. Key informant interviewees represented the following sectors: academic research (3%), community based organizations (54%), health care (35%), public health (3%), and social services (19%), with some interviewees representing multiple sectors. These 37 key informants reported working with the following populations: low-income (89%), medically underserved (92%), and racial or ethnic minorities (92%). The racial and ethnic minority groups specified by interviewees included: Latino/Hispanic, Black, Asian Pacific Islander, Southeast Asian, Native American, East Indian, Middle Eastern, Slavic and refugees from the former Soviet Union. In addition, key informants specified working with the following vulnerable sub-populations: individuals experiencing homelessness, individuals diagnosed with a developmental disability, serious mental illness and/or substance abuse disorders, pregnant women, teen parents, single parents, undocumented individuals, those with language barriers, individuals identifying as lesbian, gay, bisexual or transgender (LGBT), children and seniors who have experienced abuse and/or neglect, and those utilizing public assistance programs.

Community Focus Groups

Focus group interviews were conducted with community members representing vulnerable populations and locations identified through the initial analysis of key informant input. Recruitment consisted of referrals from designated service providers as well as direct outreach from the Valley Vision CHNA Team to acquire input from medically underserved, minority and low-income populations and/or community members living in vulnerable locations.

Within the Methodist HSA, 15 focus groups were conducted with participants who were medically underserved, impoverished, socially and/or linguistically isolated and/or those who had chronic conditions. Of the approximately 153 people who completed demographic data cards, the median age was 39; 73% identified as female, 25% as male, and 4% as other. In addition, 30% indicated they were not high school graduates; 12% indicated they were not covered by health insurance, and 57% received some form of public assistance. The self-reported racial breakdown of focus group participants is as follows:

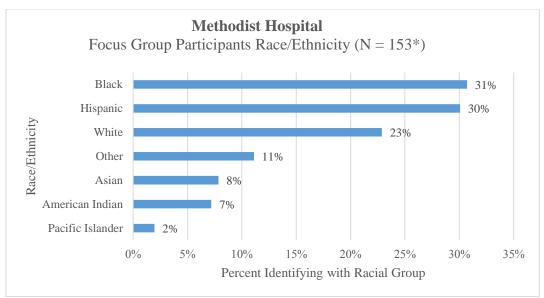

Figure 7: Focus Group Participant Demographics

*Please note: demographic surveys were not completed by all participants

Processing Primary Data

After each interview or focus group was completed, the recording and any notes were uploaded to a secure server for future analysis. A significant portion of key informant interviews and focus group recordings were sent to a transcription service, with a smaller portion transcribed by Valley Vision staff or converted into notes corresponding to the order of questions in the interview guides.

Content analysis was done on the key informant and focus group transcripts utilizing NVivo 10/11 Qualitative Analytical Software. This analysis was completed in a two-phase approach. In the first phase of analysis the qualitative data were coded based on the Bay Area Regional Health Inequities Initiative (BARHII) Framework categories and other organically arising thematic areas. Further analysis was then conducted with thematic coding to the eight potential health need categories detailed later in this report and in Appendix C, with additional codes for vulnerable populations and locations and resource identification.

Information Gaps/Limitations

Information gaps that limit the ability of this CHNA to assess the community's health needs included limited data on specific populations and access to key informants and focus group participants.

Some data were only available at a county level, making an assessment of health needs at a neighborhood level challenging. Furthermore, disaggregated data around age, ethnicity, race, and gender are not available for all data indicators, which limited the ability to examine disparities of health within the community. Lastly, data are not always collected on a yearly basis, meaning that some data are several years old.

For primary data collection, it was a challenge to gain access to participants in communities that disproportionately experience health disparities. Measures were taken to reach out to vulnerable populations and locations through the process of Focus Community identification and following recommendations of early key informants. However, recruitment was variable and several key contacts expressed the issue of research fatigue from repeated needs assessments. Community members also

frequently mentioned distrust of the research process or concerns that their input would not lead to changes in their communities. As best as possible, the research team attempted to address these concerns and to be open and transparent about the full CHNA process. All participants were given contact information of the staff that conducted their interviews and were encouraged to reach out with any additional questions; key informants were also assured that they would receive notification once the CHNA reports become available.

Another challenge was reconciling the secondary and primary data. The quantitative data used for the identification of significant health needs was examined at the Hospital Service Area (HSA) level. Alternately, a large share of the qualitative data was deliberately sourced from low-income, minority and medically underserved populations or their representatives. Owing to this discrepancy, certain health need categories were validated by either the quantitative or the qualitative data, rather than by both of these data sources.

CHNA Collaborative

The 2016 CHNA for Methodist Hospital of Sacramento was completed as part of a collaboration of the four major health systems in the Greater Sacramento region: Dignity Health, Kaiser Permanente, Sutter Health and UC Davis Health System. The CHNA Collaborative served to collectively conduct the 2016 CHNA and to support a coordinated approach to community benefit planning for 15 hospitals in the Sacramento Region including:

- **Dignity Health**: Mercy General Hospital, Mercy Hospital of Folsom, Methodist Hospital of Sacramento, Mercy San Juan Medical Center, Sierra Nevada Memorial Hospital, Woodland Memorial Hospital
- Kaiser Permanente of Greater Sacramento: Kaiser Permanente Roseville, Kaiser Permanente Sacramento, Kaiser Permanente South Sacramento
- Sutter Health Valley Area: Sutter Auburn Faith Hospital, Sutter Center for Psychiatry, Sutter Davis Hospital, Sutter Medical Center Sacramento, Sutter Roseville Medical Center
- UC Davis Health System: UC Davis Medical Center

Consultants Used to Help Conduct the CHNA

The 2016 CHNA was completed by Valley Vision, a regional leadership organization committed to making the Sacramento region a great place to live, work and recreate. The CHNA Collaborative contracted with Valley Vision in 2016 and 2013 to conduct their CHNA and in 2010 and 2007 for the statewide CNA. The collaborative process has built and strengthened partnerships between hospitals and other stakeholders, providing a coordinated approach to identifying priority health needs as well as developing plans to improve the health of the Sacramento region.

Valley Vision was selected to conduct the 2016 CHNAs in the Sacramento Region given its history of working with the CHNA Collaborative, mixed methods research skills and strong commitment to drawing attention to critical unmet health needs. Valley Vision has been a leading social enterprise and nonprofit consultancy for the Sacramento region since 1994 with the ability to deliver trusted research, design and drive multi-stakeholder initiatives and access a set of powerful leadership networks across the region. The Valley Vision team consisted of Giovanna Forno, BS, Alan Lange, MPA, Amelia Lawless, CHES, ASW, MPH, Anna Rosenbaum, MSW, MPH, Katie Strautman, MSW Sarah Underwood, MPH and Jenny Wagner, MPH(C). The CHNA

team brought a rich skill-set from years of experience working in public health, health care, social service and other public sectors.

The Valley Vision team conducted primary qualitative data collection, analyzed primary and secondary data, synthesized these data to determine the significant and prioritized health needs, documented findings and wrote the draft and final CHNA reports. Valley Vision also contracted with Dr. Heather Diaz, Dr. Mathew C. Schmidtlein and Dr. Dale Ainsworth of Community Health Insights who assisted with project design, research methodology, data processing and GIS mapping for the CHNA. Community Health Insights is a Sacramento based research-oriented consulting firm dedicated to improving the health and wellbeing of communities across Northern California.

ASSESSMENT DATA AND FINDINGS

The main findings of this assessment are organized in accordance to the BARHII model beginning with the most downstream factors (mortality and morbidity) and moving backwards to the upstream factors (risk behaviors and living conditions).

Mortality and Morbidity in the Methodist HSA

Examination of health outcomes for the assessment included measures of illness (morbidity) and death (mortality) including communicable and non- communicable diseases, and injuries. The conditions examined included: chronic disease, cancer, respiratory health, mental health, substance abuse, sexually transmitted infections (including HIV/AIDS), tuberculosis, and dental health, along with unintentional and self-inflicted injuries. This section begins with an examination of overall health indicators including age-adjusted all-cause mortality, infant mortality, and life expectancy at birth.

Overall Health Status – Rates of Age-adjusted All-Cause Mortality, Infant Mortality and Life Expectancy at Birth

These overall health status indicators provide information about what it is like to live in a Methodist Hospital community on an everyday basis. Though specific measures of mortality show how communities suffer from specific conditions, overall health status indicators communicate length of life, quality of life, socioeconomic factors and the intersection of the environment and personal behaviors. Table 6 examines three common overall health status indicators: age-adjusted all-cause mortality, infant mortality, and life expectancy at birth for each of the Methodist Focus Communities. Values and cells marked with a dash indicate that data was not provided due to small cell counts (less than 5) or that it was missing or unavailable for that ZIP code. Values in blue are those that fall above or below the desired direction in comparison to county, state and national benchmarks.

Table 6: Overall Health Status Indicators: Age-Adjusted All-Cause Mortality, Infant Mortality, and Life

Expectancy at Birth

Expectancy at Birtii		Age-Adjusted	Infant	Life

	CA State	64.60	4.90	80.50
	National 2013			78.80^{2}
	Healthy People 2020 Target		6.00^{3}	

Source: CDPH, 2010-2012 *Indicates Focus Community

Age-adjusted all-cause mortality rates were higher than the county benchmark in three of the 14 ZIP codes that constitute the Methodist HSA, all of which are Focus Communities. Ten of the 14 ZIP codes exceeded the state benchmark for all-cause mortality. Age-adjusted all-cause mortality was highest in 95823 (Fruitridge), at 80.93 deaths per 10,000 population. Infant mortality rates exceeded the county benchmark in three of the 14 ZIP codes, with the highest rate in 95823 (Fruitridge), at 6.11 infant deaths per 1,000 live births. Life expectancy at birth was below that of Sacramento County in seven of the 14 ZIP codes, including all six Focus Communities. The lowest life expectancy was seen in ZIP code 95820 (Tahoe Park).

Chronic Diseases – Diabetes, Heart Disease, Stroke, Hypertension and Kidney Disease

Both primary and secondary data indicated that most chronic illnesses are common in the Methodist HSA. Key informant interviews and community members specifically stated challenges with diabetes, hypertension, heart disease and stroke, coupled with many residents living with co-morbidities. Primary data showed that participants recognized these chronic conditions to be an outcome of a lack of other behavioral and environmental factors.

Diabetes

Diabetes was the seventh leading cause of death nationally in 2013⁴. Diabetes is listed first in this CHNA as it was a commonly mentioned health issue for community residents and quantitative findings show clear geographic health disparities across the Methodist HSA. Table 7 displays rates of mortality, ED visits, and hospitalizations due to diabetes for each Focus Community.

Rates – Mortality, ED Visits and Hospitalizations due to Diabetes

Table 7: Mortality, ED Visit, and Hospitalization Rates for Diabetes Compared to County, State, and

Healthy People 2020 Benchmarks (Rates per 10,000 Population)

	ZIP Code	Mortality	ED Visits	Hospitalizations

	Sacramento County	2.26	281.27	200.65
	CA State	2.11	209.15	192.30
	Healthy People 2020 Target	6.60		

Sources: Mortality: CDPH, 2012; ED visits and hospitalizations: OSHPD, 2011-2013 *Indicates Focus Community

Rates of mortality due to diabetes exceeded the county benchmark in five of the 14 ZIP codes. The highest rate of diabetes-related mortality was seen in Focus Community 95822 (Executive Airport/Meadowview), at 2.87 deaths per 10,000 population. Rates of diabetes-related ED visits and hospitalizations exceeded the respective county benchmarks in six ZIP codes, all of which are Focus Communities. ZIP code 95823 (Fruitridge) had the highest rate of ED visits related to diabetes, at 560.83 ED visits per 10,000 population. ZIP code 95832 (Lower Meadowview) had the highest rate of hospitalizations related to diabetes, at 361.96 hospitalizations per 10,000 population.

Percent – Adults Over 20 Years with Diabetes

Reported by the National Center for Chronic Disease Prevention and Health Promotion, the percent of adults over the age of 20 that have ever been told by a doctor that they have diabetes for 2012 was 8.0% for Sacramento County, the same percent as the state. Please note that the Sacramento County rate was used when data was not available at the ZIP code or HSA levels.

_

⁴ Centers for Disease Control and Prevention. (2015). *Leading Causes of Death*. Retrieved from: http://www.cdc.gov/nchs/fastats/leading-causes-of-death.htm

Percent – Medicare Patients with Diabetes who Received an hA1c Exam

Preventive screening for diabetes is important. Lack of screening and follow up care for diabetes was mentioned in the primary data as a big concern for area residents. According to the Dartmouth College Institute for Health Policy & Clinical Practice in 2012, the percent of Medicare patients with diabetes which report having had an hA1c exam to monitor their diabetes diagnosis in Sacramento County was 80.0%, just below the state percent of 82.0%.

Heart Disease

Heart disease is the leading cause of death in the nation for individuals under the age of 85. Heart disease includes a number of different types of heart-related conditions, with coronary heart disease being the most common and a major cause of heart attacks. More than 600,000 people die of heart disease each year. ⁵ Table 8 examines rates for mortality, ED visits, and hospitalizations due to heart disease.

	Healthy People 2020 Target	10.10		

Sources: Mortality: CDPH, 2012; ED visits and hospitalizations: OSHPD, 2011-2013

Examination of mortality due to heart disease revealed that 13 of the 14 ZIP codes had rates higher than the Healthy People 2020 benchmark. Four ZIP codes also exceeded the county benchmark for heart disease-related mortality, with the highest rate in Focus Community 95822 (Executive Airport/Meadowview). Rates of heart disease-related ED visits exceeded the county benchmark in seven ZIP codes, including five of the six Focus Communities. The highest rate of ED visits related to heart disease was in ZIP code 95823 (Fruitridge), at 307.36 ED visits per 10,000 population. Rates of hospitalizations related to heart disease exceeded the county benchmark in seven ZIP codes, including all six Focus Communities. The highest hospitalization rate was seen in ZIP code 95832 (Lower Meadowview), at 360.96 hospitalizations per 10,000 population. Relative to county benchmarks, ZIP codes 95820 (Tahoe Park) and 95822 (Executive Airport/Meadowview) had higher rates of mortality, ED visits and hospitalizations related to heart disease.

Percent – Adults over 18 Years with Heart Disease

The California Health Interview Survey indicates that for 2011-2012, the percent of adults over the age of 18 that have ever been told by a doctor they have heart disease was 5.2% for Sacramento County, lower than the state percent at 6.0%.

^{*}Indicates Focus Community

Stroke, Hypertension and Kidney Disease

The fifth leading cause of death nationally is stroke. Approximately 800,000 people have a stroke each year, with the most common type being that which restricts blood flow to the brain. Tobacco smoking and hypertension drastically increase risk of stroke. Hypertension is common in approximately one out of every three adults. Stroke, hypertension, and kidney disease are discussed in this section. Hypertension also increases risk for kidney diseases, along with heart disease and diabetes. Tables 9, 10, and 11 examine mortality, ED visits, and hospitalizations related to stroke, hypertension, and kidney disease.

Rates – Mortality, ED Visits and Hospitalizations due to Stroke

Table 9: Mortality, ED Visit and Hospitalization Rates for Stroke Compared to County, State, and

Healthy People 2020 Benchmarks (Rates per 10,000 Population)

	Healthy People 2020 Target	3.40		

Sources: Mortality: CDPH, 2012; ED visits and hospitalizations: OSHPD, 2011-2013

Mortality rates due to stroke were high in three of the 14 ZIP codes, relative to the county benchmark. Focus Communities 95820 (Tahoe Park) and 95822 (Executive Airport/Meadowview) had the highest rates of stroke-related mortality, at 5.39 and 5.26 deaths per 10,000 population, respectively. ED visits related to stroke were elevated in nine ZIP codes, including five of the six Focus Communities. The highest rate of stroke-related ED visits was seen in ZIP code 95823 (Fruitridge), at 50.03 ED visits per 10,000 population. Rates of hospitalizations related to stroke exceeded the county benchmark in eight of the 14 ZIP codes, including all six Focus Communities. The highest rate of stroke-related hospitalizations was in ZIP code 95823 (Fruitridge), at 86.71 hospitalizations per 10,000 population. Focus Community

	CA State	1.21	408.99	383.74

Sources: Mortality: CDPH, 2012; ED visits and hospitalizations: OSHPD, 2011-2013

Mortality rates due to hypertension were above the state benchmark in five of the 14 ZIP codes, including four of the six Focus Communities. Rates of ED visits and hospitalizations due to hypertension exceeded county and state benchmarks in six ZIP codes, all of which are Focus Communities. ZIP codes 95823 (Fruitridge) and 95832 (Lower Meadowview) had the highest rates of ED visits and hospitalizations related to hypertension. In both ZIP codes, rates of hypertension-related ED visits were more than twice the state rate.

Primary data showed that participants specifically mentioned high blood pressure as a challenging issue for area residents. Accessing medication refills for blood pressure management was noted as an area challenge with many residents, especially low income, using the emergency room as an avenue to get their medication refills. As one community member stated:

A lot of high blood pressure, cholesterol, is something that we see people come in to the ER.... come in to the ER for a refill on their high blood pressure medication because they are not able to get in to see their doctor to get that refill soon enough. (FG 14)

Percent – Adults with Hypertension Not Taking Medication

The Centers for Disease Control and Prevention Behavioral Risk Factor Surveillance System survey results for 2006-2010 indicate that the percentage of adults self-reporting high blood pressure who do not take medication was 26.0% for Sacramento County, below the state percent of 30.0%.

^{*}Indicates Focus Community

Mortality rates due to kidney disease were elevated in three ZIP codes, all of which are Focus Communities. The highest rate of kidney disease-related mortality was in ZIP code 95822 (Executive Airport/Meadowview), at 1.00 death per 10,000 population. The county rate of ED visits related to kidney disease is nearly twice that of the state. Rates of ED visits exceeded the state rate in all 14 ZIP codes, eight of which also exceeded the county benchmark. The highest rate of ED visits related to kidney disease was seen in Focus Community 95823 (Fruitridge), at 201.42 ED visits per 10,000 population. Hospitalization rates associated with kidney disease were elevated in eight ZIP codes, including all six Focus Communities. ZIP code 95832 (Lower Meadowview) had the highest rate of hospitalizations due to kidney disease, at 311.51 hospitalizations per 10,000 population.

Cancer – Incidence, ED Visit, Hospitalization, Mortality and Screening Rates by Specific Type of Cancer

Cancer is one of the leading causes of death in the nation, with more than 8% of the population receiving a cancer diagnosis at least once in their lifetime⁹. In an attempt to gain a better understanding of how residents of the Methodist HSA are affected by cancer, the assessment included the examination of cancer incidence for female breast, colorectal, lung and prostate cancers at the ZIP code level. All-cause cancer mortality and ED visits and hospitalizations for specific types of cancer were also examined by ZIP code and included lung cancer, colorectal cancer, prostate cancer, and female breast cancer. These specific cancers were chosen for this assessment because they are among the leading causes of new cases and/or

⁹ Centers for Disease Control and Prevention. (2015). *Cancer*. Retrieved from:

http://www.cdc.gov/nchs/fastats/cancer.htm

deaths due to cancer among Americans today. Screening rates for breast cancer, cervical cancer and colorectal cancer were also examined at the HSA level.

Rates - Breast (Female), Colorectal, Lung, and Prostate Cancer Incidence

Cancer incidence communicates risk for cancer within the Focus Communities. Table 12 shows incidence rates for female breast, colorectal, lung and prostate cancer for each of the ZIP codes. Rates for each ZIP code are compared to a Methodist HSA rate, as well as the state rate.

Table 12: Cancer Incidence (New Cases) for Female Breast Cancer, Colorectal Cancer, Lung Cancer and

Prostate Cancer (Rates per 10,000 Population)

	ZIP Code	Breast- Female Cancer	Colorectal Cancer	Lung Cancer	Prostate Cancer
	95624	17.28	4.80	4.95	14.78

	CA State	13.16	3.88	4.54	11.61

Source: California Cancer Registry, 2010-2012 *Indicates Focus Community

The breast cancer incidence rate for the Methodist HSA was clearly above the state benchmark. Nine of the 14 ZIP codes had breast cancer incidence rates above that of the state, with the highest rates in ZIP codes 95693 (Wilton) and 95831 (Pocket). Colorectal cancer incidence rates were above the state benchmark in eight ZIP codes, four of which are Focus Communities. ZIP code 95822 (Executive Airport/Meadowview) had the highest incidence rate of colorectal cancer, at 4.99 new cases per 10,000 population. Lung cancer incidence rates were above the state benchmark in eight ZIP codes, with the highest rate in ZIP code 95822 (Executive Airport/Meadowview). Incidence rates for prostate cancer were above the state benchmark in six ZIP codes, with the highest rate in ZIP code 95831 (Pocket). ZIP codes 95624 (Elk Grove), 95822 (Executive Airport/Meadowview), and 95831 (Pocket) had elevated rates of all four types of cancer, relative to state benchmarks.

Rates – All-Cause Cancer Mortality and Lung Cancer ED Visits and Hospitalizations

An all-cause cancer mortality rate shows the overall effect of cancer as an illness in the Focus Communities. Unfortunately, mortality data due to specific cancers is not available at the sub county level, and therefore is not included in this assessment. However, ED visits and hospitalization rates due to lung cancer are reported in Table 13, followed by rates for colorectal, prostate and female breast cancer in Table 14.

Table 13: Mortality Rates for All-Cause Cancer, and ED Visits and Hospitalization Rates for Lung Cancer Compared to County, State, and Healthy People 2020 Benchmarks (Rates per 10,000 Population)

ZIP Code	Mortality All-Cause Cancer	ED Visits Lung Cancer	Hospitalizations Lung Cancer
95624	13.58	3.75	7.30
95632	16.27	4.11	7.63

Healthy People 2020	16.10		

Source: Mortality: CDPH, 2012; ED visits: OSHPD, 2011-2013 *Indicates Focus Community

Seven of the 14 ZIP codes exceeded the state benchmark and Healthy People 2020 goal for mortality due to all-cause cancer. Four of these ZIP codes also exceeded the county benchmark, with the highest rate in ZIP code 95822 (Executive Airport/Meadowview). Rates of ED visits related to lung cancer exceeded the county benchmark in six ZIP codes, with the highest rate in 95693 (Wilton), at 5.94 ED visits per 10,000 population. Rates of hospitalizations related to lung cancer exceeded the county benchmark in four ZIP codes, with the highest rate in 95822 (Executive Airport/Meadowview).

Rates – Female Breast, Colorectal, Prostate Cancer ED Visits and Hospitalizations

A lack of access to primary health care greatly affects the risk for late diagnosis of cancer, especially those cancers for which early diagnosis and prevention are important in order to reduce further related morbidity and mortality. Table 14 examines ED visits and hospitalizations related to female breast cancer, colorectal cancer (male and female) and prostate cancer.

Table 14: Rates of ED Visits and Hospitalizations for Female Breast Cancer, Colorectal Cancer, and Prostate Cancer (Rates per 10 000 Population)

ZIP Code	ED visits Female Breast Cancer	Hospitalization Female Breast Cancer	ED visits Colorectal Cancer	Hospitalization Colorectal Cancer	ED visits Prostate Cancer	Hospitalization Prostate Cancer

Source: OSHPD, 2011-2013 *Indicates Focus Community

Rates of ED visits related to breast cancer among females exceeded the state benchmark in eight of the 14 ZIP codes. Focus Community 95822 (Executive Airport/Meadowview) exceeded both state and county benchmarks, at 9.79 ED visits per 10,000 female population. Three ZIP codes had breast cancer-related hospitalization rates above county and state benchmarks, with the highest rate in 95831 (Pocket), at 13.19 hospitalizations per 10,000 female population. Rates of ED visits related to colorectal cancer exceeded the state benchmark in 10 ZIP codes, four of which also exceeded the county benchmark. Rates of hospitalizations related to colorectal cancer were above the county benchmark in six ZIP codes, with the highest rate in Focus Community 95820 (Tahoe Park). Rates of ED visits related to prostate cancer were above the state benchmark in nine ZIP codes, three of which also exceeded the county benchmark. Hospitalization rates associated with prostate cancer exceeded the county benchmark in six ZIP codes, with the highest rate in Focus Community 95822 (Executive Airport/Meadowview).

Screening Rates – Breast (Mammogram), Cervical (Pap) and Colorectal (Sigmoid/Colonoscopy) Cancer Data on the percent of Medicare enrollees aged 67-69 or older shown in Figure 8 reports the percent receiving a mammogram within the last two years was the same for Sacramento County and the state benchmark. The percent of female adults over the age of 18 that reported having had a pap test in the last three years for Sacramento County was lower than the state percent at 78%. However, more 50-year-olds in Sacramento County report having had a sigmoidoscopy or colonoscopy at least once in compared to the state.

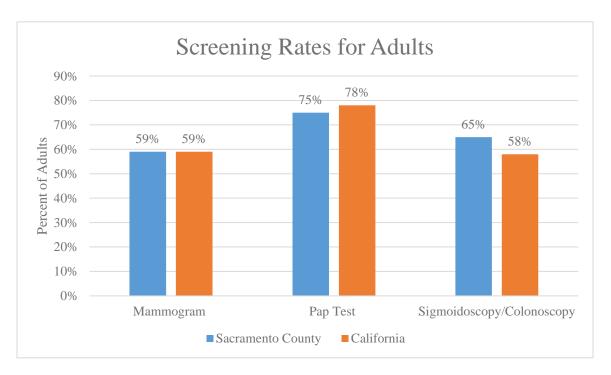

Figure 8: Screening Rates in Adults for Mammograms, Pap Test and Sigmoidoscopy/Colonoscopy

Respiratory Health – Chronic Obstructive Pulmonary Disease (COPD), Asthma, and Tuberculosis

COPD is a progressive lung disease that makes it very hard to breathe and refers to the two main conditions of emphysema and chronic bronchitis. ¹⁰ Tobacco smoking is the biggest risk factor for COPD. As many as 6.8 million people have COPD at the national level. Tuberculosis is a respiratory condition caused by a bacterium called Mycobacterium tuberculosis. In 2014 there were 2.96 cases of TB per 100,000 population in the United States. ¹¹ In an effort to understand the impact of respiratory illness in the Methodist HSA, mortality rates for chronic lower respiratory disease (CLRD) are presented in Table 15 along with rates of ED visits and hospitalizations related to COPD. Rates of ED visits and hospitalization due specifically to asthma are examined independently in Table 16.

Source: Mortality: CDPH, 2012; ED visits: OSHPD, 2011-2013 *Indicates Focus Community

Mortality rates associated with chronic lower respiratory disease (CLRD) exceeded the county benchmark in two ZIP codes, with the highest rate in Focus Community 95822 (Executive Airport/Meadowview). Rates of ED visits and hospitalizations related to chronic obstructive pulmonary disease (COPD) exceeded the respective county benchmarks in six ZIP codes, all of which are Focus Communities. ZIP code 95823 (Fruitridge) had the highest rate of COPD-related ED visits, at 542.59 ED visits per 10,000 population. ZIP code 95820 (Tahoe Park) had the highest hospitalization rate for COPD, at 268.82 hospitalizations per 10,000 population.

Rates – ED Visits and Hospitalizations due to Asthma

Asthma is one of the leading health issues in the US. National data indicates that one in 12 adults and one in 11 children have asthma. Table 16 examines ED visits and hospitalizations due to asthma (all ages).

Table 16: ED Visit and Hospitalization Rates due to Asthma Compared to County and State Benchmarks

(Rates per 10,000 Population)

	ZIP Code	ED Visits	Hospitalizations

Source: OSHPD, 2011-2013 *Indicates Focus Community

All six Focus Communities had asthma-related ED visit and hospitalization rates that fell above both the county and state benchmarks. ZIP code 95823 (Fruitridge) had the highest rates of ED visits and hospitalizations related to asthma, at 390.32 ED visits and 140.64 hospitalizations per 10,000 population. These rates were well above the respective county rates and twice the state rates.

Key informants and community members mentioned asthma as a major issue for area residents. Managing asthma in both the school and home environment were mentioned as big areas of need. As one key informant expert stated

Asthma awareness, how do you mitigate some of those things for families within their own environments, keeping things clean and diet and behavior, what smoking does for folks? I think that's also a huge part of the reason why there's such a huge problem with asthma and advocacy around kind of built spaces and all that. (KI 10)

Percent – Adults Over Age 18 with Asthma

As reported by the Centers for Disease Control and Prevention from the Behavioral Risk Factor Surveillance System survey, the percent of adults over the age of 18 that have ever been told by a doctor that they have asthma was 18.4% for Sacramento County, above the state percent of 14.2% in 2011-2012.

Rates – ED Visits and Hospitalizations due to Tuberculosis

Table 17: ED Visit and Hospitalization Rates due to Tuberculosis Compared to County and State

Source: OSHPD, 2011-2013 *Indicates Focus Community

Rates of ED visits related to tuberculosis (TB) are higher than the county benchmark in 10 ZIP codes, including all six Focus Communities, ZIP code 95820 (Tahoe Park) had the highest rate of ED visits related to tuberculosis, at 0.38 ED visits per 10,000 population, more than twice the county and state rates. Twelve ZIP codes had TB-related hospitalization rates above the county benchmark, with the highest rate in Focus Community 95832 (Lower Meadowview). The hospitalization rate among residents of this Focus Community is more than three times the county rate and more than twice the state rate.

Mental Health

Mental illness is defined as "health conditions that are characterized by alterations in thinking, mood, or behavior (or some combination thereof) associated with distress and/or impaired functioning."13 Depression is the most common type of mental illness in the United States and by 2020 is expected to be the second leading cause of disability worldwide. Mental illness is strongly correlated with many risk factors for chronic disease, including physical inactivity, smoking, excessive drinking, and insufficient sleep. 14 Rates of ED visits and hospitalizations due to mental health conditions are provided in Table 18 as a way of examining mental health in the Methodist HSA.

Source: OSHPD, 2011-2013 *Indicates Focus Community

Rates of ED visits due to mental health conditions were high in five ZIP codes, all of which are Focus Communities. The highest rate of ED visits related to mental health conditions was found in ZIP code 95823 (Fruitridge), at 426.88 ED visits per 10,000 population. Mental health-related hospitalization rates were above the county benchmark in four of the six Focus Communities. The highest rate of hospitalizations was in ZIP code 95820 (Tahoe Park), at 306.08 hospitalizations per 10,000 population.

One of the major findings of the primary data was the high frequency of mental illness in the Methodist HSA and the need for mental health services and psychiatric emergency services. Changes in the mental health provider network in the last few years has resulted in many residents going untreated for mental illness. Participants discussed patients needing care for mental illness having a difficult time getting adequate care in the HSA. One community member spoke about the challenges with seeking psychiatric care in the emergency department that it is, "not uncommon to have those with SMI experiencing poor ER care, waiting in the hallways for 3 days during psychotic episodes" (FG 9).

The need for access to mental health/behavioral services was mentioned in all 41 primary data sources. Mental illness ranged from anxiety and depression to schizophrenia. Participants also spoke about mental illness in individuals experiencing homelessness, stating the majority of the homeless population suffers from mental illness. As one provider stated:

So I definitely see that there are a lot of challenges and again we do see a very high number of these patients we have 29 beds in the ER that I work in and the majority of the time more than half of them are filled with either homeless or mental health patients (FG 14).

Percent – Adults Reporting Insufficient Social and Emotional Support at the HSA Level

Aggregated data from the Centers for Disease Control and Prevention Behavioral Risk Factor Surveillance System survey for 2006-2012 showed that 21% of respondents in Sacramento County, over the age of 18, indicated that they receive insufficient social and emotional support most of the time. This percent was lower than the state percent at 25% of respondents.

Participants also spoke about the importance of residents feeling a sense of social and community connectedness with one another. As one community member stated:

The reality is that there is no plan for this community, because they really want to get rid of it... They wanted for every poor person to get out, it's gentrification. So there really is no plan, which they won't say, but that's really the plan because the homeownership is important here. So how they do it, they run you out and they rebuild and sell the houses and people are coming in to change the neighborhood and they are going to continue to change it...This community is not valued, it's not seen as worth saving, there is no plan to save it. When you look at the actions and the laws and you look at the development, what the plans for development are...there is nothing addressing any of the community's concerns. The barrier for this community is that there is no plan and there is no desire to have one. We need a 20 year plan, a real plan from the mayor's office on down...And once that's done to back it up with all of the components of what a healthy community looks like. This community is shrinking. To make it healthier, we need a complete plan...It's culturally diverse in Oak Park, it's more culturally diverse than it's ever been. (FG_1)

Dental Health

Oral health is important to overall quality of life. The data used in this assessment to examine the status of oral health in the Methodist HSA was ED visits and hospitalization due to dental conditions. This data is dated from 2011 – 2013, before the reinstatement of dental coverage under the state Medicaid (Medi-Cal) program. Additional examination of data on dental health is included in later sections of the report in the "Access to Care" section.

Rates – ED visits and Hospitalizations due to Dental Health

Source: OSHPD, 2011-2013 *Indicates Focus Community

Rates of ED visits related to dental health issues exceeded the county benchmark in six ZIP codes, all of which are Focus Communities. ZIP code 95823 (Fruitridge) had the highest rate of ED visits related to dental conditions, at 132.13 ED visits per 10,000 population. The rate of dental health-related ED visits in this community is more than three times the state benchmark and nearly twice the county benchmark. ZIP code 95824 (Parkway) had the highest rate of hospitalizations related to dental conditions, at 12.76 hospitalizations per 10,000 population.

Injury – Intentional (Suicide and Self- inflicted injury) and Unintentional

In 2013, suicide was the 10th leading cause of death nationally, and the second leading cause of death for Americans 15-34 years of age. ¹⁵ Unintentional injury was the third leading cause of death overall but the first leading cause of death for Americans 1-44 years of age.

Sources: Mortality: CDPH, 2012; ED visits and hospitalizations: OSHPD, 2011-2013 *Indicates Focus Community

Mortality rates due to suicide varied throughout the Methodist HSA and within the Focus Communities. Seven of the 14 ZIP codes had rates of mortality due to suicide that exceeded the state and Healthy People 2020 benchmarks. Three ZIP codes also exceeded the county benchmark, with the highest rate in 95823 (Fruitridge). Rates of ED visits related to self-inflicted injuries were elevated in five ZIP codes, all of which are Focus Communities. The highest rate of ED visits related to self-inflicted injuries was in ZIP code 95823 (Fruitridge), at 22.37 ED visits per 10,000 population, well above the county benchmark and more than twice the state benchmark. ZIP code 95820 (Tahoe Park) had the highest rate of hospitalizations for self-inflicted injuries, at 7.92 hospitalizations per 10,000 population.

Mortality rates due to unintentional injuries exceeded the state benchmark in eight ZIP codes. Six ZIP codes also exceeded the county benchmark, with the highest rate of mortality due to unintentional injuries in ZIP code 95693 (Wilton), at 4.62 deaths per 10,000 population. Rates of ED visits related to unintentional injuries were elevated in all six Focus Communities, with the highest rate in ZIP code 95823 (Fruitridge), at 1053.90 ED visits per 10,000 population. Hospitalization rates for unintentional injuries were elevated in four ZIP codes, including three Focus Communities. ZIP code 95820 (Tahoe Park) had the highest rate of hospitalizations related to unintentional injuries, at 222.01 hospitalizations per 10,000 population. Relative to county benchmarks, ZIP codes 95820 (Tahoe Park) and 95823 (Fruitridge) had elevated rates of mortality, ED visits, and hospitalizations related to unintentional injuries.

Risk Behaviors and Living Conditions in the Methodist HSA

Risk behaviors contribute to increased risk for morbidity and mortality of most health conditions in a community and are often the focus of community-based health promotion efforts. These risk behaviors include smoking, poor nutrition, physical inactivity, violent behavior, alcohol and drug usage, and risky sexual behaviors. In order to gain a clear understanding of reasons behind why individuals engage in risky behavior it is equally important to consider the conditions in which they live. These living conditions include the physical, social, economic/work, and service environments.

Risk Behaviors – Substance Abuse, Poor Nutrition, Physical Inactivity, and Risky Sexual Behavior

This section of the report will detail all indicators used in the assessment to examine the various risk behaviors in the Methodist HSA.

Substance Abuse

Substance abuse, specifically the use of alcohol and drugs, is a leading preventable cause of death in the United States, costing states millions of dollars each year in treatment costs. ¹⁶ Alcohol-impaired driving is the cause of 33% of all fatal car accidents. ¹⁷ This assessment included examination of multiple indicators addressing substance abuse. The indicators presented here include: rates of ED visits and hospitalizations due to substance abuse by ZIP code, alcohol and tobacco smoking prevalence, liquor store access, and percent of household expenditures for alcohol and tobacco. Prescription drug abuse has also become a major problem for adults nationally. ¹⁸

Rates – ED visits and Hospitalizations due to Substance Abuse

Table 22: ED Visit and Hospitalization Rates due to Substance Abuse Compared to County and State Benchmarks (Rates per 10,000 Population)

	ZIP Code	ED Visits	Hospitalizations
	95624	247.65	107.02
	95632	275.45	136.07
	95693	268.25	158.92

	95826	407.35	171.10
	95828*	473.24	191.13
	95829	208.40	89.07
	95831	227.50	113.32
	95832*	581.99	212.09
	Methodist HSA	401.56	172.43
	Sacramento County	438.58	196.40
	CA State	253.80	145.00

Source: OSHPD, 2011-2013 *Indicates Focus Community

Rates of ED visits related to substance abuse were elevated in all six Focus Communities, relative to county and state benchmarks. ZIP code 95823 (Fruitridge) had the highest rate of ED visits related to substance abuse, at 739.11 ED visits per 10,000 population. Substance abuse-related hospitalization rates exceeded the county benchmark in five of these same communities. ZIP code 95820 (Tahoe Park) had the highest rate of hospitalizations related to substance abuse, at 308.28 hospitalizations per 10,000

^{**}coded under Mental Health codes

¹⁷ Ibid

¹⁸ Ibid.

population. Among residents of this community, rates of ED visits and hospitalizations related to substance abuse are more than twice the respective state benchmarks.

Primary data participants also spoke about the need for more inpatient substance abuse treatment facilities in the county, saying that the current infrastructure for care is broken. Many residents seek episodic care in the emergency departments and community clinics in their neighborhoods. However, such lack of consistent intensive care results in a revolving door for many residents struggling with substance abuse.

Percent – Adults Reporting Excessive Alcohol Consumption

Results of the national Center for Disease Control and Prevention Behavioral Risk Factor Surveillance System survey indicated that approximately 18% of respondents in Sacramento County reported engaging in excessive alcohol consumption (more than 2 drinks per day for males and more than 1 per day for females), one percent higher than the state rate of 17%.

Rate – Liquor Store Access per 100,000 Population

Data on liquor stores from the US Census Bureau for 2012 revealed that Sacramento County has 8.11 liquor stores per 100,000 people, compared to the state rate of 10.02 per 100,000 population.

Percent – Home Expenditures for Alcohol

Alcohol expenditure data from Nielson included the percent of at-home expenditures for alcohol at the census tract level. Data for 2014 aggregated to the HSA level showed that the percent of expenditures for the Methodist HSA was 14.60%, above the state percent at 12.93%.

Percent – Prevalence of Tobacco Usage

Data taken from the California Health Interview Survey for 2014 showed that the percent of smoking among adults and teens was 15.1% for the Methodist HSA, compared to the state benchmark of 10.8%.

Percent – Home Expenditures Spent on Tobacco

Tobacco expenditure data from Nielsen included the percent of at-home expenditures for tobacco products at the census tract level. This indicator aggregated to the HSA level revealed that the percent of expenditures for the Methodist HSA was 1.3% compared to the state percent at 1.0% for 2014.

Poor Nutrition and Physical Inactivity

Consideration of diet and exercise data for this health assessment also includes an examination of obesity data. Though obesity is a clear outcome of poor dietary choices and a lack of adequate exercise, it is also a contributor to most of the morbidity and mortality health conditions mentioned in the previous sections of the report. Many factors contribute to high rates of obesity, poor nutrition, lack of physical activity and chronic disease in the Focus Communities. These factors include conditions of poverty, access to health care and healthy foods, pollution in a community, and education to name a few. One key informant described the challenge that area service providers have in addressing the multitude of needs in the Focus Communities. The key informant stated "It is just trying to bail the ocean with a teacup" (KI 2).

Percent – Overweight and Obese in Youth

Table 23: Percent Overweight and Obese in Youth Grades 5th, 7th and 9th as Measured by the FitnessGram by County in the Methodist HSA

Indicator	Percent Overweight	Percent Obese
Sacramento County	19.4%	17.5%
CA State	19.3%	19.0%

Source: California Department of Education, 2013-2014

As the data presented in Table 23 indicates, the percent overweight in youth is slightly higher in Sacramento County compared to the state benchmark, yet lower for percent obese. Additionally, data by race and ethnicity indicated that the percent of overweight for White students was 17.6% compared to Black students at 21.7% and for Hispanic students at 21.4%. Unfortunately, overweight and obesity data are seldom available at the sub-county level in order to examine how rates compare within the county.

Percent – Mothers Reporting Breastfeeding

Research indicates that when a child is breastfed the risk for negative health conditions decreases; specifically, there is a reduction in the risk of infant mortality. According to data from the California Department of Public Health for 2012, the percent of mothers breastfeeding their infants at birth was slightly lower for Sacramento County at 91.7% compared to the state percent at 93.0%. Data by race and ethnicity revealed that while 95.3% of Whites report breastfeeding, only 87.3% of Blacks, 93.5% of Hispanic/Latinos, 87.7% of Asians, and 92.3% of Native American/Alaskan Natives report breastfeeding.

Area - USDA Defined Food Desert

The USDA defines a food desert as: "urban neighborhoods and rural towns without ready access to fresh, healthy, and affordable food. Instead of supermarkets and grocery stores, these communities may have no food access or are served only by fast food restaurants and convenience stores that offer few healthy, affordable food options." The lack of access to healthy food often results in poor diet among residents and can lead to higher levels of obesity and other diet-related diseases, such as diabetes and heart disease. The USDA further describes a food desert as "a census tract with a substantial share of residents who live in low-income areas that have low levels of access to a grocery store or healthy, affordable food retail outlet." Figure 9 identifies food deserts within the Methodist HSA.

²⁰ Ibid.

-

¹⁹ US Department of Agriculture. (n.d.) *Food Deserts*. Retrieved from: https://apps.ams.usda.gov/fooddeserts/fooddeserts.aspx

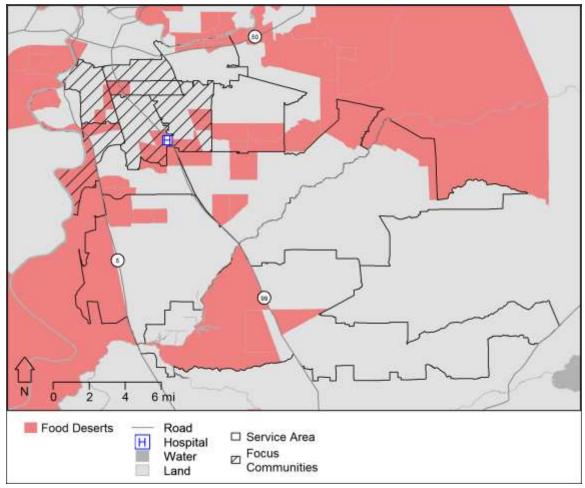

Figure 9: USDA Defined Food Deserts

As shown in Figure 9, portions of 13 of the 14 ZIP codes were designated USDA-defined food deserts. The only ZIP code in the Methodist HSA which did not contain a food desert area was 95820 (Tahoe Park).

Primary data indicated that a lack of retail in low income areas in the Methodist HSA means a lack of access to transportation to healthy and affordable food. One service provider stated that there are, "definitely some food deserts, it's very difficult to access grocery stores that have produce just because of bus routes" (KI_10). Participants also spoke about the absence of high quality grocery stores and healthy foods in low income areas of the county, yet an overabundance of unhealthy options. As one community member mentioned:

You know, I just want to share an observation. I was thinking of some time ago and it popped in my head right now. In that, so our neighborhoods are Food Source, Food Co, Winco, you walk in these stores and the first thing you see are packaged foods, like processed foods. You see cakes, you see cookies, crackers, but if you walk into a Safeway in a good community, if you walk into Trader Joe's, the first thing you see if produce. You see fresh apples, you see, it's very interesting but if you walk into these other stores that are much cheaper that is the first thing you see is all the processed foods. (FG_14)

Many participants talked about the saturation of fast food and unhealthy options in lower income communities of the county. Data that follows supports this conclusion. As one community member stated:

You're probably working long hours and to come home and cook a healthy meal it takes more energy, more time, you know there's that and these communities there is a fast food restaurant on every corner. I have like 5 that are surrounding my house so it's so easy, very cheap, so easy to just get off of work and stop at McDonalds or stop, and not to pick something up that doesn't break the bank so for sure I think that income goes into the lifestyle. (FG_14).

Percent – Population with Food Insecurity and Receiving Supplementary Nutrition Assistance Program According to Feeding America, the percentage of population with food insecurity in 2013 for Sacramento County was higher than the state percent. Also, the percentage of population receiving SNAP (Supplementary Nutrition Assistance Program) in 2011 was higher for Sacramento County compared to the state percent.

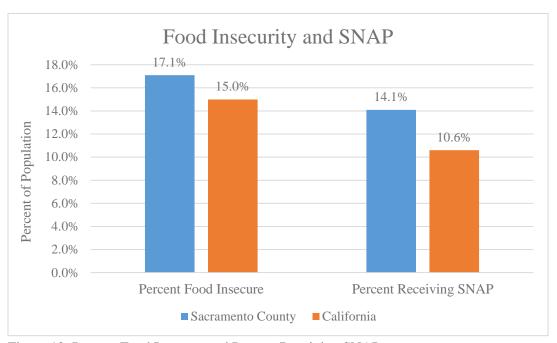

Figure 10: Percent Food Insecure and Percent Receiving SNAP

Index – Modified Retail Food Environment Index (mRFEI)

The Modified Retail Food Environment Index (mRFEI) consists of two aspects of food availability: the presence of food outlets within a ZIP code and the relative abundance of healthier food outlets. Negative mRFEI values occur in areas with no food outlets. All other values report the percentage of healthier food outlets, from among all food outlets, in the ZIP code. Figure 11 shows the mRFEI for the Methodist HSA. Lighter areas indicate poor or no access to healthy food outlets and darker areas indicate greater access to healthy food outlets.

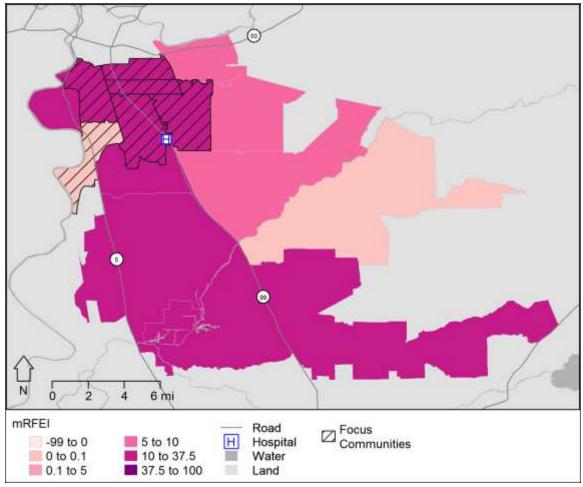

Figure 11: Modified Retail Food Environment Index (mRFEI)

As shown in Figure 11, many ZIP codes within the HSA had low mRFEI scores, indicating poor or no access to healthy foods. Specific mention are the ZIP code areas of 95832 (Lower Meadowview) and 95693 (Wilton), which had the lowest index values compared to all other HSA ZIP codes. The ZIP code with the greatest index value, indicating greater access to healthy food outlets, was 95824 (Parkway).

Rate – Fast Food Restaurants and Grocery Stores per 100,000 Population

According to business data reported by the US Census Bureau, the rate of fast food restaurants for the Methodist HSA was lower than the state rate of 74.51 per 100,000 population. Additionally, the rate of grocery stores for the HSA was slightly lower than the state rate. Figure 12 shows the exact data for each indicator.

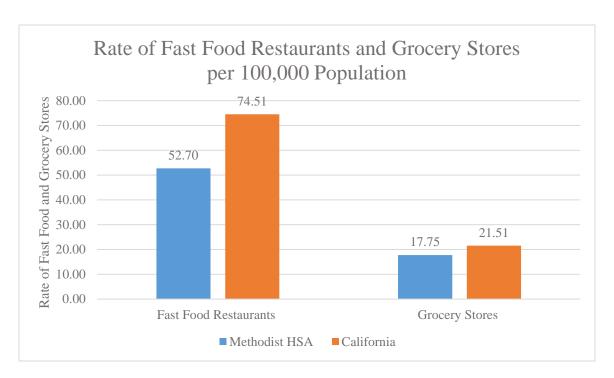

Figure 12: Fast Food Restaurants and Grocery Stores per 100,000 Population

Percent – Youth Eating Less than Five Servings of Fruits and Vegetables a Day

Data from the 2011-2012 California Health Interview Survey indicated that 48.0% of youth in Sacramento County report eating less than five servings of fruits and vegetables daily, only slightly above the state rate at 47.4%. Examination by race and ethnicity showed that 43.5% of Whites report eating less than five servings a day, compared to Blacks at 36.2% and Hispanic/Latino youth at 43.0%.

Percent – Home Expenditures Spent on Fruits and Vegetables and Soda

Results for the percent of at-home food expenditures for fruits and vegetables, as well as soda, were notable for the Methodist HSA. Data from Nielsen for 2014 showed the percent spent for fruits and vegetables for the HSA was 13.2%, lower than the state percent at 14.1%. However, the inverse is true for soda expenditures. The soda expenditure percent is 3.9% for the Methodist HSA, above the state percent of 3.6%.

Percent – Physical Inactivity for Adults and Youth

Quality indicators that examine physical activity in the HSA are very difficult to obtain. In 2012, the Centers for Disease Control (CDC) reported that the percent of adults over the age of 20 indicating they perform no regular physical activity for Sacramento County was 16.8%, slightly higher than the state rate of 13.3%. Physical inactivity among youth in Sacramento County, as reported by the FitnessGram Physical Fitness Test, was slightly lower than the state. There were 35.3% of youth in grades 5, 7, and 9 classified as physically inactive, compared to the state percent at 35.9%. Examination by race and ethnicity for Sacramento County revealed that while 30.5% of Whites were classified as physically inactive, 42.3% of Blacks, 31.4% of Asian, 44.6% of Hispanic/Latino and 36.6% of non-Hispanic multiple race were classified as physically inactive.

Percent of Population Living within One-Half Mile of a Park

Access to recreational areas contributes to whether or not people will be physically active. Figure 13 shows the percent of the population by ZIP code in the Methodist HSA that live within one-half mile of a

recreational park. The lighter colors denote fewer residents with nearby park access and darker colors show more residents living within one-half mile of a park.

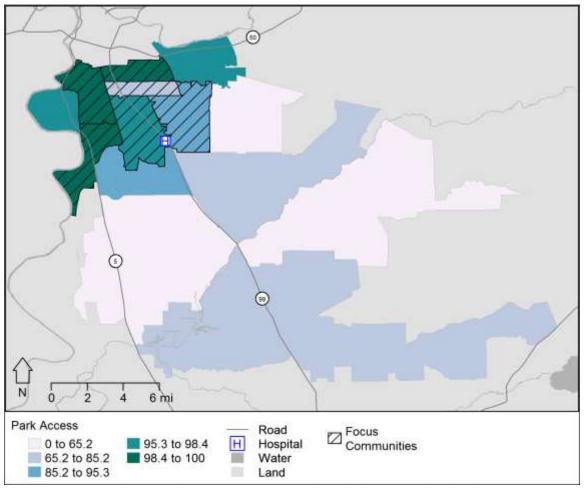

Figure 13: Percent of Population by ZIP Code that Live within One-Half Mile of a Park

As displayed in Figure 13, access to a park varied among ZIP codes within the HSA. ZIP codes 95693 (Wilton), 95757 (Elk Grove) and 95829 (Vineyard) had the lowest percent of population with access to a park in their community. Having access to a park or physical space where people of all ages can engage in play and be physically active is important for overall health and wellbeing.

Key informants and community members stated that community parks are lacking in Focus Communities of the HSA. Additionally, where parks do exist there are concerns of safety and many residents are hesitant to play in the parks or engage in physical activity in the neighborhoods.

Go down to Fruitridge and there are no walking groups there, it's so unsafe due to gunfire and shootings. And retaliation shootings. They tell seniors to buddy up. It's sad to have to carry a taser on you, but they'll steal from anyone – even someone in a wheelchair (FG_1).

Risky Sexual Behavior – Teen Birth Rate and Sexually Transmitted Infections (Chlamydia, Gonorrhea, and HIV/AIDS)

Rate – Teen births to Women Under the Age of 20

Teen birth rate (births to women under the age of 20) is an indicator used in this assessment to examine sexual behavior throughout the HSA. Data from 2013 indicates that the national rate for teen births (age 15-19) is currently 26.5 per 1,000 live births. ²¹ Figure 14 shows the teen birth rate for the Methodist HSA.

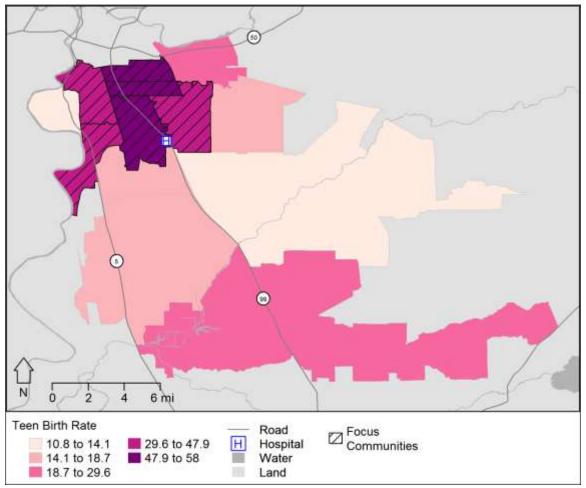

Figure 14: Teen Birth Rate for 15-19 Year Olds per 1,000 Live Births

Seven of the 14 ZIP codes, including all six Focus Communities, had teen birth rates higher than the state rate of 28.3 teen births per 1,000 live births. The highest teen birth rates were seen in ZIP codes 95823 (Fruitridge), 95824 (Parkway) and 95820 (Tahoe Park).

Sexually Transmitted Infections (STI) – Chlamydia, Gonorrhea, and HIV/AIDS

Rates of sexually-transmitted infections (STI), including chlamydia, gonorrhea, and HIV, illustrate the presence of risky sexual behavior in the HSA. Since STIs are largely preventable, knowing where community members are infected by STIs helps with targeting interventions for treatment and prevention.

56

²¹ Centers for Disease Control and Prevention. (2015). *Teen Births*. Retrieved from: http://www.cdc.gov/nchs/fastats/teen-births.htm

Table 24 displays incidence rates for chlamydia and gonorrhea by ZIP code for 2014 compared to county and state benchmarks. Incidence rates are a measure of risk for a condition. Table 25 shows rates of ED visits and hospitalizations related to STIs, as well as those specific to HIV/AIDS.

Rates – Chlamydia and Gonorrhea Incidence

Table 24: Chlamydia and Gonorrhea (New Cases) Compared to County and State Benchmarks (Rates per

10,000 Population)

- 1,000 - 1 pm	ZIP Code	Chlamydia Incidence	Gonorrhea Incidence
	95624	-	-
	95632	27.43	4.35
	95693	35.46	-
	95757	28.54	4.68
	95758	41.21	6.21
	95820*	63.00	20.02
STI Incidence	95822*	57.64	19.52
	95823*	85.09	26.16
	95824*	65.77	20.79
	95826	55.89	13.97
	95828*	52.79	13.61
	95829	35.99	6.65
	95831	37.60	7.76
	95832*	107.87	28.21
	Sacramento County	47.07	12.51
	CA State	45.34	11.68

Source: Sacramento County Public Health, 2014 *Indicates Focus Community

Incidence rates for chlamydia and gonorrhea were above both the county and state benchmarks in seven ZIP codes, including all six Focus Communities. ZIP codes 95832 (Lower Meadowview) and 95823 (Fruitridge) had the highest incidence rates of chlamydia and gonorrhea, both alarmingly high relative to county and state benchmarks.

Rates – ED Visits and Hospitalization due to STIs and HIV/AIDS

Table 25: ED Visit and Hospitalization Rates due to STIs and HIV/AIDS Compared to County and State

Benchmarks (Rates per 10,000 Population)

	ZIP Code	ED visits STIs	Hospitalizations STIs	ED visits HIV/AIDS**	Hospitalizations HIV/AIDS**
	95624	2.63	1.25	1.46	0.74
	95632	0.92	0.71	0.13	0.14
	95693	4.10	1.93	2.91	0.72
	95757	1.71	1.16	0.74	0.42
	95758	3.16	1.86	0.82	0.61
	95820*	9.90	6.96	3.77	5.87

	Methodist HSA	6.15	3.53	2.55	2.36
	Sacramento County	5.53	3.95	2.23	2.78
	CA State	3.20	4.58	1.95	3.36

Source: OSHPD, 2011-2013 *Indicates Focus Community

Table 25 indicates that rates of STI-related ED visits were elevated above the state and county benchmarks in seven ZIP codes, including all six Focus Communities. The highest rate of STI-related ED visits was in ZIP code 95823 (Fruitridge), at 12.60 ED visits per 10,000 population, more than twice the county benchmark. Rates of hospitalizations related to STIs exceeded the county benchmark in six ZIP codes, all of which are Focus Communities. ZIP code 95820 (Tahoe Park) had the highest rate of hospitalizations related to STIs, at 6.96 hospitalizations per 10,000 population. Rates of ED visits related to HIV/AIDS were elevated in eight ZIP codes, including all six Focus Communities. Five of these ZIP codes also had elevated rates of HIV/AIDS-related hospitalizations, relative to county and state benchmarks. ZIP code 95823 (Fruitridge) had the highest rate of ED visits for HIV/AIDS, at 5.58 ED visits per 10,000 population. ZIP code 95820 (Tahoe Park) had the highest rate of hospitalizations related to HIV/AIDS, at 5.87 hospitalizations per 10,000 population.

Rate – Prevalence of HIV/AIDS per 100,000 Population

The CDC reported that for 2010, the prevalence of HIV/AIDS in the Methodist HSA was 272.4 cases per 100,000 population, lower than the state rate at 363.0 cases per 100,000 population. Data by race and ethnicity showed that Whites had a rate of 303.65 cases per 100,000, compared to Blacks at 655.7 cases per 100,000 and Hispanic/Latino at 198.85 cases per 100,000.

Percent – Adults Never Screened for HIV

Data from the national Centers for Disease Control and Prevention Behavioral Risk Factor Surveillance System survey for 2011-2012 indicated that as many as 61.0% of respondents between 18-70 years of age in Sacramento County reported never being screened for HIV, equal to the state percent.

^{**}HIV/AIDS is considered a subcategory of STIs in the ICD 9 diagnostic codes.

Living Conditions – Physical Environment, Social Environment, Economic/Work **Environment and Service Environment**

This section of the report will examine various indicators which help to illuminate the daily living conditions of residents of the Methodist HSA. The indicators are organized in accordance to the BARHII model discussed previously in the sections: physical environment, social environment, economic/work environment, and service environment.

Physical Environment

Examination of the physical environment of the Methodist HSA included analyzing indicators of transportation, traffic accidents, housing, and pollution.

Area – Population Living One-Half Mile Near a Transit Stop

There are limits to the distances community members will travel to access public transportation services. These distances are documented in research and vary due to a number of factors including climate, attractiveness of the area, and the amount of traffic on streets. 22 Most research states that individuals will travel no more than one-fourth to one-third of a mile to access public transportation. Identifying areas in the HSA that are at least one-half mile from a transit station helps to highlight transportation availability in the area. Figure 15 shows areas of the Methodist HSA that are within one-half mile from a transit stop.

²²Building Transit-Friendly Communities: A design and development strategy for the Tri-State Metropolitan Region (1997). Regional Plan Association. Retrieved from: http://ntl.bts.gov/DOCS/GL.html

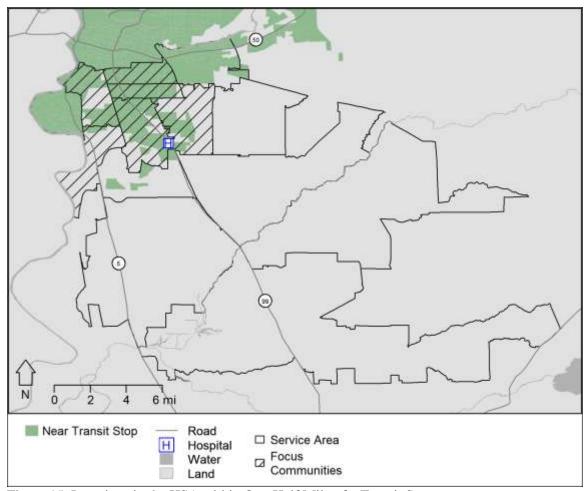

Figure 15: Locations in the HSA within One-Half Mile of a Transit Stop

In Figure 15, grey shaded portions of the map are more than a half-mile from a transit stop. As the figure displays, many ZIP codes within the HSA have areas that do not have transit stops within one-half mile.

Percent – Households with No Vehicle

Having access to a vehicle is an important factor in the determination of a person's ability to access the things they need to stay healthy. A working vehicle means the ability to get to work, to the grocery store, to school, and to access health care. Figure 16 shows the percent of households with no vehicle in the Methodist HSA.

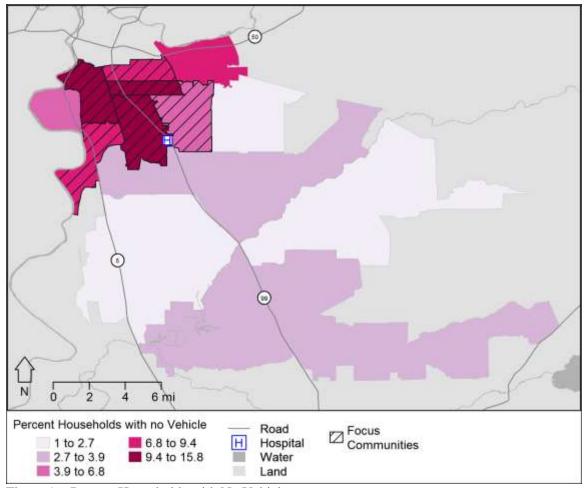

Figure 16: Percent Households with No Vehicle

The percent of households with no vehicle was 7.8% for the state and 7.6% for Sacramento County. As Figure 16 shows, many ZIP codes within the HSA have a high percentage of households with no vehicle. The four ZIP codes with the highest percent of households with no vehicle were Focus Communities 95824 (Parkway) at 15.8%, 95823 (Fruitridge) at 11.7%, 95822 (Executive Airport/Meadowview) at 9.6%, and 95820 (Tahoe Park) at 9.2%.

Lack of safe and affordable transportation was mentioned as a significant barrier for HSA residents and is the sixth prioritized health need for the Methodist HSA. Transportation was mentioned as a barrier to accessing health care, healthy foods, employment, and education. Participants stated that the current public transportation system in the HSA can be very expensive, sometimes unreliable or unsafe, and can be far from where they live. One service provider said:

Then that's the third component of that is transportation and it's a huge problem in our region affecting the ...people that we serve and affecting the poor and marginalized people that we serve and again it's great that we've managed to open up the gates in some areas around healthcare, we know that it's really just serving ... the back of the system. Too many people are loaded on that sinking boat but that's what had to happen and it's great to see that but if you cannot get to your appointment, if you're going to be punished and targeted by RT to get some ... because you're trying to ride the bus or you're trying to ride the Light Rail to get to where you need to go that is

criminalization of poverty and that's going to keep people from being healthy and getting access to their care (FG 7)

Many community members said that they desired to purchase healthier foods, but that transportation barriers can make it challenging to travel to areas with grocery stores. As one community member stated, "Transportation is an issue. Trader Joe's or Sprouts we can't get too…it would take your whole day on the bus" (FG 13).

Many other participants spoke about transportation as a major barrier to accessing health care services. As one provider stated "I am going to go back to the two that I think are having such a huge impact...it is the transportation thing again; it seems so unrelated to healthcare, but it is enormous" (KI_3). Participants spoke about many transportation options associated with various health providers, but that the ability to access these services was complicated. The lack of transportation and the time that it takes to get to resources can be very challenging and add unnecessary stress to residents' daily lives. One service provider spoke about a patient's barriers to accessing mental health care related to transportation, "Transportation was an issue because she had to walk four miles to get to the Light Rail..." (FG 2).

Another key informant discussed challenges of accessing medical care while being on a fixed income:

The resources are too far away and hard to get to without transportation, especially for single mothers with kids that have health problems. Most of us don't have a car. I have to take two buses and a light rail and it takes too long. If one organization had a van or bus for to make it to these appointments, it would help a lot. Even a volunteer. This would be good community service for our residents (FG_3).

Percent – Workers that Commute more than 60 Minutes to Work

Long commute times are associated with increased likelihood of being overweight, higher blood pressure, increased stress and neck pain, exposure to more pollution, and negative affect. ²³ Figure 17 displays the percent of workers in each ZIP code who commute more than 60 minutes to work.

_

²³ MacMillan, A. (2015). Five ways your commute is hurting your health. Retrieved from: http://news.health.com/2015/03/3<u>1/5-ways-your-commute-is-hurting-your-health/</u>

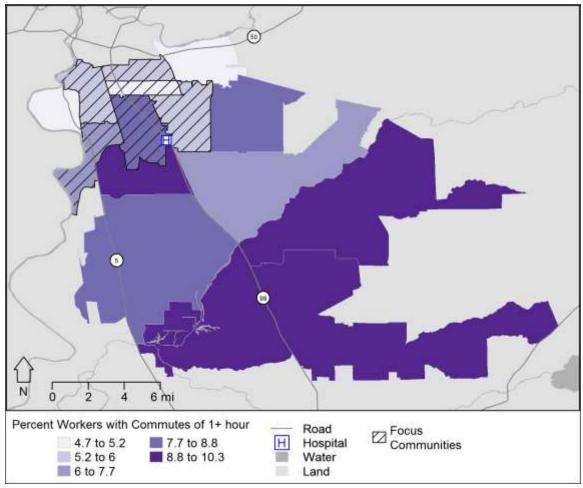

Figure 17: Percent Workers with Commutes of 1+ Hour

Many ZIP codes within the Methodist HSA had a high percentage of residents commuting more than 60 minutes to work. ZIP code 95632 (Galt) had the highest percent of residents commuting more than 60 minutes, at 10.3%, followed by ZIP codes 95693 (Wilton) at 9.7% and 95758 (Elk Grove) at 9.4%.

Percent – Workers Reporting Commuting Alone and Walking/Biking to Work

As displayed in Figure 18, data from the US Census Bureau indicted that 74.7% of respondents in the Methodist HSA over the age of 16 years old reported commuting to work alone, slightly higher than the state percent. The Census data also indicated that 2.0% of HSA respondents stated that they walk or bike to work, just below the state percent of 3.8%.

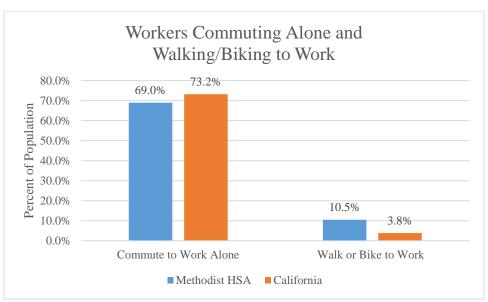

Figure 18: Percent of Workers Commuting to Work Alone and Walking or Biking to Work

Rate – Road Density Network per Square Mile

Examination of road network density revealed that Sacramento County has substantially more roads per square mile than the state. The number of roads per square mile for Sacramento County was 6.04 compared to the state rate of 2.02 roads per square mile. Increased road density is related to increased exposure to vehicle emissions and other environmental pollutants which negatively impact health.

Area – Fatal Traffic Accidents

ZIP codes 95823 and 95758 had the highest numbers of fatal accidents relative to all other ZIP codes in the Methodist HSA. The ZIP code of 95823 (Fruitridge) had the most, at six accidents in 2013, followed by 95758 (Elk Grove) at five. Though it can be expected that fatal traffic accidents are more likely to occur on major highways, fatal traffic accidents in residential communities help to illuminate safety issues in the area. ZIP codes 95823 and 95758 are heavily residential areas.

Rate – Fatal Accidents per 100,000 Population Involving a Motor Vehicle and/or Pedestrian

The rate of fatal motor vehicle accidents for 2010-2012, as reported by the California Department of Public Health, in Figure 19 showed that the Methodist HSA rate of fatal accidents was below the state rate. In addition, fatal accidents involving a pedestrian (motor vehicle killed a pedestrian) was above the state rate.

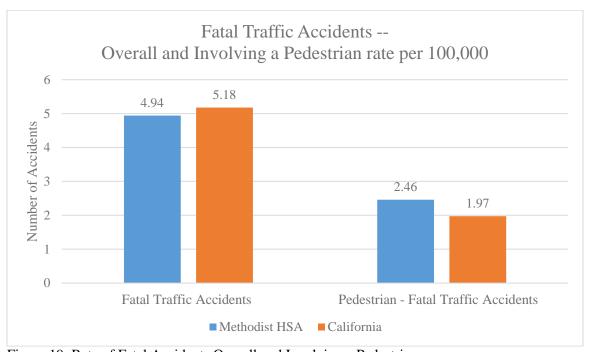

Figure 19: Rate of Fatal Accidents Overall and Involving a Pedestrian

Key informants spoke about a concern over the built environment in many of the Focus Communities in the Methodist HSA. One big issue of concern was the speed at which people drive, especially when drivers use alcohol and other drugs in tandem. As one key informant stated, "It's mainly speed and also them, driving under the influence. Yes, so for many of them, you find that it is related to drug or alcohol abuse as well (KI 1)"

Housing Stability – Percent Housing Vacancy, People per Housing Unit and Percent Renting

Stable, clean and affordable housing is an essential public health need. The lack of a stable place to live can have negative health effects on individuals and families, making it hard to manage daily life responsibilities.²⁴ Table 26 shows rates for various housing indicators by ZIP code for the Methodist HSA as an indicator of housing stability.

Table 26: Percent Housing Vacancy, People per Housing Unit, and Percent Renting

ZIP Code	Percent Housing Vacancy	People per Housing Unit	Percent Renting
95624	4.4	3.28	22.4
95632	4.0	3.14	29.5
95693	9.3	2.60	17.2
95757	6.4	3.62	29.4
95758	4.0	3.02	31.0
95820*	9.2	2.77	45.9
95822*	7.7	2.74	42.4
95823*	7.0	3.20	52.4
95824*	7.1	3.18	57.6
95826	7.8	2.45	46.0
95828*	6.8	3.43	40.0
95829	5.1	3.33	23.7
95831	7.4	2.28	42.3
95832*	8.8	4.02	49.6
Sacramento County	7.2	2.72	43.3
CA State	8.6	2.94	44.7

Source: Census, 2013 *Indicates Focus Community

High vacancy rates are indicators of housing market conditions²⁵, specifically the affordability of housing in the area. Six ZIP codes had vacancy rates above the county benchmark, with the highest percentages of housing vacancy in ZIP codes 95693 (Wilton), 95820 (Tahoe Park), and 95832 (Lower Meadowview), where rates exceeded both county and state benchmarks. The number of people per housing unit is an indicator of multiple people living together, which can be an indicator of poverty. Eleven of the 14 ZIP codes had people-per-housing-unit rates above the county benchmark. ZIP codes 95832 (Lower Meadowview) and 95757 (Elk Grove) had the highest rates, at 4.02 and 3.62 people per housing unit, respectively. Also, a large number of renters in a given geographic area can be an indicator of the area's economic stability as well as housing costs. Focus Communities 95824 (Parkway) and 95823 (Fruitridge) have the highest percentages of renters, with 57.6% and 52.4% of residents renting their homes, respectively.

²⁴ John Hopkins University. (2016). Stable Housing. Retrieved from: http://www.jhsph.edu/research/centers-and-institutes/johns-hopkins-center-to-eliminate-cardiovascular-health-disparities/about/influences_on_health/stable_housing.html

disparities/about/influences_on_health/stable_housing.html

25 Belsky, E.S. (n.d.) *Vacancy rates: A policy primer*. Housing Policy Debate, vol 3(I3), 793-814. Retrieved from: http://content.knowledgeplex.org/kp2/img/cache/kp/2627.pdf

Primary data participants spoke about the housing insecurity and the high cost of housing in areas throughout the Methodist HSA, especially in lower income communities where renting is more common than homeownership. As one key informant stated,

But they want economic diversity that comes in through home ownership and there's not a lot of home ownership here. So this area does not generate tax dollars. When you rent you're not paying taxes, it doesn't go to the city. Homeowners are more valuable than renters. And 90% of what's happening in Oak Park is renting, so no tax dollars are coming here because everyone is renting (FG_1).

Another informant stated "A lot of our communities just have this really overwhelmingly difficult conditions for living" (KI_27). Challenges in accessing housing created many challenges for community members in maintaining their health and transitioning to more stability. One service provider stated:

We are confronted daily with huge housing crisis in our region and it feels we feel powerless to be able to help people with all the things that we may be able to help them with. We may be able to get them enrolled in Medi-Cal and we may be able to try to help them navigate those systems or see if we can help with medications but you can't make it over to the pharmacy or get to an appointment with a psychiatrist if you slept in the bushes last night or if you're looking at a housing situation that's dangerous to your health so housing is a huge problem in our region that has to be looked at through a health lens and we need to have sustainable solutions that are innovative and creative and also consider the intersections of where folks come from (FG_7).

Rate – Households that are HUD Households per 10,000 Housing Units

The United States Department of Housing and Urban Development (HUD) reported in 2013 that the total number of HUD funded housing units in Sacramento County was 357.08 units per 10,000 housing units, below the state rate of 368.32 units per 10,000. This is an important indicator as access to affordable housing impacts a person's economic stability and ability to access other basic needs such as health care, affordable healthy foods, and places to be physically active.

Percent – Households with at least One Substandard Housing Condition

HUD also reports that in 2013 the percent of households defined as substandard was 44.8% in Sacramento County, lower than the state percent at 48.4% of households.

Housing Costs – Households with Mortgage Costs Greater than 30% and Households with Rental Costs Greater than 30% of Household Income

The high cost of housing can be a barrier for community members to maintain stable housing and optimal health. Data on the cost of housing for the Methodist HSA included the examination of two indicators: housing costs with a mortgage payment greater than 30% of the household's income and rental housing payments greater than 30% of the household income. Figures 20 and 21 show these two indicators across the HSA.

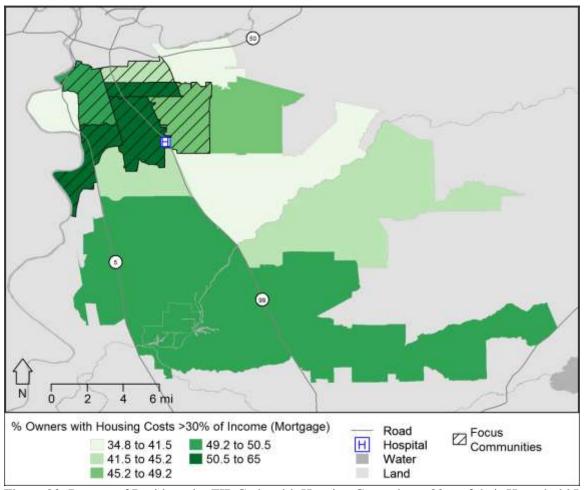

Figure 20: Percent of Residents by ZIP Code with Housing Costs above 30% of their Household Income with a Mortgage Payment

Nine of the 14 ZIP codes exceeded the county benchmark for the percent of residents with a housing mortgage cost of greater than 30% of their household income. The ZIP codes with the highest percentages included Focus Communities 95832 (Lower Meadowview) at 65.0%, 95823 (Fruitridge) at 52.0%, and 95824 (Parkway) at 51.3%.

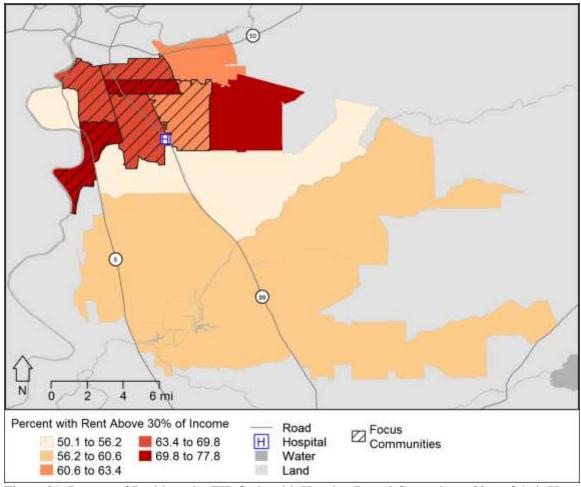

Figure 21: Percent of Residents by ZIP Code with Housing Rental Costs above 30% of their Household Income

Several ZIP codes within the Methodist HSA had high rental costs, relative to county and state benchmarks. The percent of residents with rental costs above 30% of their income was 57.5% for Sacramento County, and 56.9% for the state. ZIP codes 95832 (Lower Meadowview), 95829 (Vineyard) and 95824 (Parkway) had the highest percentages of residents with rental costs more than 30% of their income.

Index - Pollution Burden Score

The California Environmental Protection Agency and the Office of Environmental Health Hazard Assessment developed the *California Communities Environmental Health Screening Tool, Version* $2.0.^{26}$ This tool was designed to identify California communities that are disproportionately burdened by multiple sources of pollution. The tool combines 13 types of pollution, environmental factors to produce a "pollution burden" score for each census tract in the state ranging between a minimum of zero and a maximum of 100, with higher scores indicating a greater pollution burden. The pollution factors included ozone and $PM_{2.5}$ concentrations, diesel PM emissions, pesticide use, toxic releases from facilities, traffic density, drinking water contaminants, cleanup sites, impaired water bodies, groundwater threats, hazardous wastes facilities and generators, and solid waste sites and facilities.

-

²⁶ California Communities Environmental Health Screening Tool, Version 2.0 (CalEnviroScreen 2.0). Guidance and Screen Tool. October 2014. Retrieved from: http://oehha.ca.gov/ej/pdf/CES20FinalReportUpdateOct2014.pdf

A pollution burden score was identified for each census tract in the Methodist HSA and is displayed in Figure 22. Each census tract's pollution burden score ranged from zero to 100 and was assigned to a quintile, displayed in the figure using color gradation. In the figure census tracts with darker colors have higher pollution burden scores.

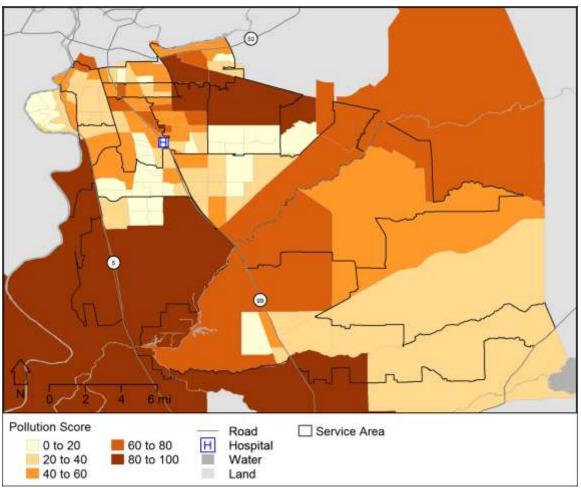

Figure 22: Pollution Burden Score by Census Tracts in the HSA

Figure 22 shows that portions of ZIP codes 95757 (Elk Grove), 95632 (Galt), 95826 (Rosemont), 95828 (Florin), 95829 (Vineyard), and 95832 (Lower Meadowview) had pollution burden scores in the highest quintile, 80-100. The effect of exposure to pollution contributes to the high rates of respiratory illness mentioned previously in this report.

Primary data participants spoke about issues of smoking in low income housing units as a big concern for the health of many residents. Trash removal from community streets and weed abatement were also mentioned as important parts of helping to remove the pollution from many Focus Communities. Participants were also concerned with pesticide use surrounding residential areas.

Social Environment

This assessment included indicators for crime, assault and homicide in the Methodist HSA. Crime data included major crimes, violent crime, property crime, arson and domestic violence.

Rates – Major Crime, Violent Crime, Property Crime, Arson and Domestic Violence

Criminal activity in a community has a strong effect on a community's actual and perceived safety. Data on major crimes reported to the California Department of Justice are provided for the law enforcement jurisdictions in the Methodist HSA and compared to estimated county benchmarks.

Table 27: Major Crime, Violent Crime, Property Crime, Arson and Domestic Violence per 10,000 Population by Police Jurisdiction

· ·					
Police Municipality	Major Crimes*	Violent Crime	Property Crime	Arson	Domestic Violence
Elk Grove	221.63	30.19	190.73	0.71	19.05
Galt	243.36	26.25	215.44	1.67	22.50
Sacramento City	460.40	66.66	390.24	3.50	32.98
Sacramento County Sheriff Department	344.68	54.56	288.94	1.18	35.44
Sacramento County	363.10	52.36	308.85	1.90	38.64

Source: California Department of Justice, 2013 *Combination of violent crimes, property crimes, and arson

Table 27 indicates that crime rates reported for the Sacramento City jurisdiction were noticeably higher than the county benchmark in four of the five crime categories. Sacramento City had a major crimes rate of 460.40 incidents per 10,000 population, substantially higher than the county benchmark of 363.10 incidents per 10,000.

Though many participants spoke about crime and violence in the Methodist HSA, crime and its impact on youth was a specific finding in the primary data. Many key informants and community members' spoke about the impact witnessing violence has on young area residents, resulting in a feeling of trauma. One service provider said "But, violence is really big for our kids. Our kids are really suffering from a lot of trauma" (KI_14). The stress of living in an environment where residents worry daily about safety issues can have potentially negative effects on health. Domestic violence and sexual assault dynamics have created significant barriers to accessing healthcare. As one service provider stated:

So, you have direct implications such as just the abuser won't let them or the abuser doesn't give them the money to pay the copayment or the abuser just doesn't allow them to interact with professionals, any of those kind of reasons. And then you have the trauma component. When you are looking at trauma if someone isn't ready to necessarily address that, then they are not going to go somewhere where most likely they are going to be asked about it and forced to address it at some level. We see that a lot with our sexual assault clients in terms of even follow up care, they don't want to because then the question may result in other questions that may lead them to open up about that assault. So, I mean the actual trauma itself can be very paralyzing for them to reach out for services and then you have other types of challenges such as transportation (KI_4).

Rates – ED Visits and Hospitalizations due to Assault

Understanding safety in the Methodist HSA requires the examination of both crime rates, as shown above, as well as incidents of intentional harm, such as rates of assault. Rates of assault (intentionally harming another person) are included in this assessment to gain an understanding of violence in the Methodist HSA. Figures 23 and 24 show ED visits and hospitalizations related to assaults in the area.

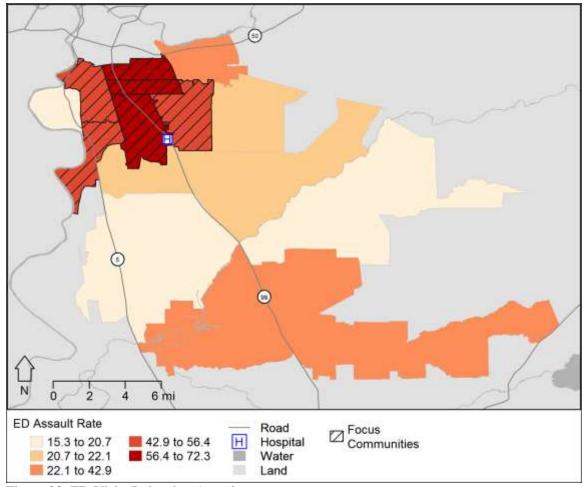

Figure 23: ED Visits Related to Assault

Rates of ED visits related to assault exceeded the county benchmark in six ZIP codes, all of which are Focus Communities. The highest rates of ED visits due to assault were seen in ZIP codes 95823 (Fruitridge) at 72.24 ED visits per 10,000 population, 95820 (Tahoe Park) at 63.79 ED visits per 10,000 population, and 95824 (Parkway) at 58.62 per ED visits per 10,000 population. These rates were considerably higher than the county benchmark of 39.1 and the state benchmark of 30.4 ED visits per 10,000 population.

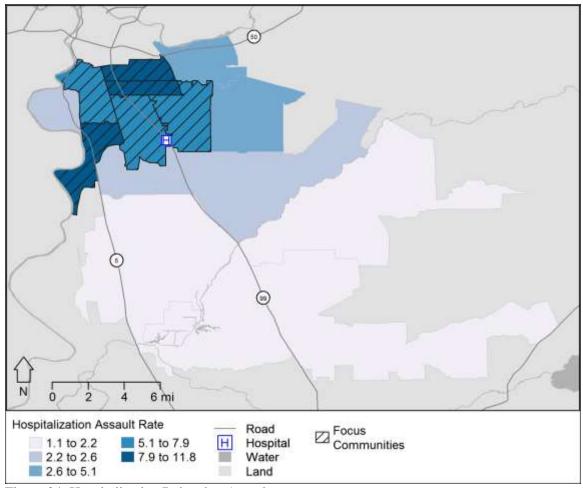

Figure 24: Hospitalization Related to Assault

Figure 24 shows that the geographic pattern seen for hospitalizations due to assault is similar to that of ED visits. Five ZIP codes exceeded the county benchmark for hospitalizations due to assault, all of which are Focus Communities. The highest rates of hospitalizations related to assault we in ZIP codes 95820 (Tahoe Park), 95824 (Parkway), and 95832 (Lower Meadowview). Assault-related hospitalization rates in these ZIP codes were more than twice the state benchmark.

Rate – Mortality due to Homicide

Data from the California Department of Public Health collected for 2010-2012 revealed that the Methodist HSA had a higher rate of mortality due to homicide relative to the state benchmark. Mortality due to homicide was 6.22 deaths per 100,000 population in the HSA compared to the state rate of 5.15 deaths per 100,000 population.

Economic and Work Environment

Economic stability is crucial to overall health and wellbeing. Community members that struggle to pay for basic needs like stable housing, adequate food, and health care are at greater risk of negative health outcomes. This assessment examined indicators related to lack of employment, income, poverty and insurance status.

Percent Unemployed and Median Income by ZIP Code

Table 28: Percent Unemployed and Median Income by ZIP Code

	ZIP Code	Percent Unemployed	Median Income
	95624	10.9	\$77,652
	95632	15.4	\$59,731
	95693	8.8	\$76,392
	95757	10.4	\$84,297
	95758	11.1	\$70,616
	95820*	18.0	\$39,295
E	95822*	15.9	\$43,624
Economic Stability	95823*	19.0	\$37,931
	95824*	19.5	\$29,771
	95826	13.2	\$53,432
	95828*	17.7	\$46,820
	95829	10.9	\$74,550
	95831	9.8	\$68,461
	95832*	20.8	\$39,735
	Sacramento County	13.7	\$55,064
G G 2012 W	CA State	11.5	\$61,094

Source: Census, 2013 *Indicates Focus Community

As Table 28 shows, the percent of residents unemployed in the Methodist HSA was higher than the county benchmark in seven ZIP codes, with the highest percentages in 95832 (Lower Meadowview) at 20.8% and 95824 (Parkway) at 19.5%, both clearly above the Sacramento County percent of 13.7% and state percent of 11.5%. All Focus Communities had median incomes drastically below the county and state median income. The lowest median income was seen in ZIP code 95824 (Parkway), at \$29,771, far below all other ZIP codes within the HSA.

Percent – Population Living in Poverty (Total Population, Families with Children, Single Female Headed Households, and Elderly Households)

Table 29: Percent Population Living in Poverty, Percent Families with Children in Poverty, Percent Single Female-Headed Households in Poverty, and Percent Elderly Households in Poverty

	ZIP Code	Percent Below Federal Poverty Level	Percent Families with Children in Poverty	Percent Single Female- Headed Households in Poverty	Percent Elderly Households in Poverty
	95624	9.1	9.8	22.2	1.3
	95632	18.1	19.9	47.6	3.1
	95693	15.2	14.5	44.1	4.2

	Sacramento County	17.6	20.1	37.6	1.9
	CA State	15.9	17.8	36.8	2.3

Source: Census, 2013 *Indicates Focus Community

Relative to the county benchmark, eight of the 14 ZIP codes had higher percentages of residents living below the federal poverty level, including all six Focus Communities. In ZIP codes 95824 (Parkway), 95832 (Lower Meadowview) and 95823 (Fruitridge), more than 30% of households had income below the federal poverty level. Relative to the county rate, seven ZIP codes had higher percentages of families with children living in poverty, including all six Focus Communities. ZIP code 95824 (Parkway) had the highest rate, with 40.1% of families with children living in poverty. ZIP codes 95832 (Lower Meadowview) and 95823 (Fruitridge) had the highest rates of poverty among single female-headed households, at 60.4% and 51.0%, respectively. The highest rate of poverty among elderly households was seen in ZIP code 95693 (Wilton).

Many key informants and community members spoke about poverty and its influence in many areas of healthy living, affecting access to quality health care, healthy foods, transportation, stable housing etc. As one key informant stated so clearly "Poverty does not discriminate" (KI_15). This key informant elaborated:

Poverty in itself would indicate a less than satisfactory quality of life. It's not always true, but when you can't put food on the table to feed your family, or you're staying with relatives and moving around from one relative to another, because you don't have a stable place to live, I mean that makes for a really challenging quality of life. (KI_15)

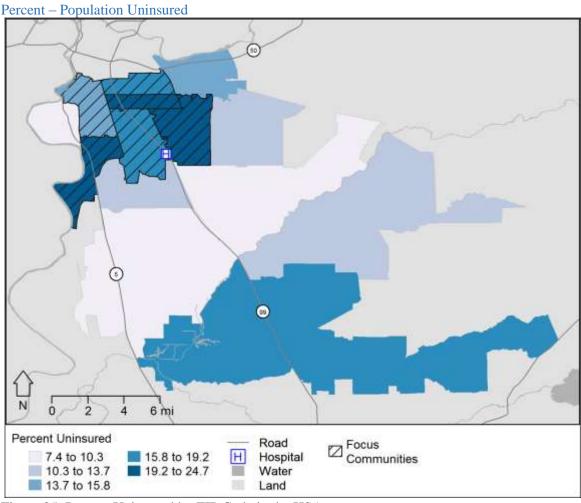

Figure 25: Percent Uninsured by ZIP Code in the HSA

The percent of population without health insurance in Sacramento County was 17.8%, while the state level was 14.6%. Eight of the 14 ZIP codes exceeded the state benchmark, five of which also exceeded the county benchmark. The highest percentages of residents without health insurance were in ZIP codes 95824 (Parkway) at 24.7% and 95832 (Lower Meadowview) at 23.6%. Primary data findings related to health insurance are discussed in the "Access to care" section of this report.

Service Environment

This assessment examined access to care measures and education in order to best understand the service environment for the Methodist HSA. Information in this section of the report examines access to care for primary care, mental health care and dental health care.

Access to Care (Primary Care, Mental Health, and Dental)

Rate – Primary Care Physicians per 100,000 Population

Data from the US Department of Health and Human Services reveals that the rate of primary care physicians per 100,000 population was 79.2 for Sacramento County in 2012, compared to the state rate of 77.2 physicians per 100,000 population.

Area – Health Professional Shortage Area – Primary Care

Health Professional Shortage Areas (HPSAs) are designated by the US Government Health Resources and Services Administration (HRSA) as having shortages of primary medical, dental, or mental health providers; these shortages may be geographic (e.g., a county or service area), demographic (e.g., a low income population) or institutional (e.g., comprehensive health center, federally qualified health center, or other public facility).²⁷

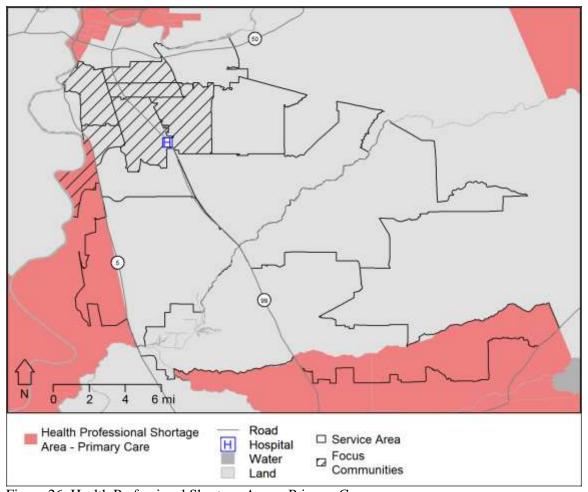

Figure 26: Health Professional Shortage Area – Primary Care

Within the Methodist HSA, portions of six ZIP codes contained areas defined as health professional shortage areas (HPSAs) for primary care services. These ZIP codes included 95632 (Galt), 95757 (Elk Grove), 95758 (Elk Grove), 95822 (Executive Airport/Meadowview), 95831 (Pocket), and 95832 (Lower Meadowview).

One of the biggest findings of the primary data was the need for increased access to primary care for residents within the Methodist HSA. Access to care is the third highest prioritized health need for the Methodist HSA. Additionally, though insurance coverage for residents in the Methodist HSA has increased as a result of the Affordable Care Act, key informant and community members consistently mentioned a lack of providers in the Focus Communities, especially Medi-Cal providers, and the need for residents to have a medical home. One community member stated "I feel that with the patients being

²⁷ Health Resources and Services Administration. (n.d.). *Primary Medical Care HPSA: Designation Overview*. Retrieved from: http://bhpr.hrsa.gov/shortage/hpsas/designationcriteria/primarycarehpsaoverview.html

assigned doctors that are not accepting new patients, it's extremely common" (FG_14). A key informant spoke about healthcare in Sacramento County, "We are at the end of the line in terms of 58 counties in the state in terms of service delivery for healthcare" (KI_27). As one provider stated about Affordable Care coverage:

...I think that's because people don't know where to go for primary care. That also brings another point of clinic expansion not keeping up with the insured population and now there's a lot of people who have access to care or should be able to have access to care but they don't because appointments are too far out, there are too many people trying to fit into that appointment slot. And I think that's a big impact of the Affordable Care act. Not enough doctors, not enough clinics (FG_14).

Primary data indicated that many community residents are experiencing long wait times until they are able to see a provider. As one key informant stated "The wait time is shorter in the ED than scheduling an appointment with a PCP (Primary Care Provider)" (KI 17).

Percent – Prenatal Care in the 1st Trimester and Low Birth Weight

Table 30: Percent of Live Births with the Mother Receiving Prenatal Care in the First Trimester and

Percent of Births with Low Birth Weight

Percent of Births with	Low Birth Weight	Dangart of Live Divide	Donount of Dintle
	ZID C. I	Percent of Live Births	Percent of Births
	ZIP Code	with Prenatal Care in	with Low Birth
		First Trimester	Weight
	95624	84.1	7.1
	95632	80.4	6.1
	95693	84.7	6.8
	95757	88.1	7.6
	95758	85.3	7.3
	95820*	76.3	7.2
	95822*	75.8	7.4

	95824*	71.6	7.0
	95826	82.1	6.5
	95828*	77.4	7.6
	95829	84.4	6.8
	95831	83.6	7.2
	95832*	75.5	7.2
	Methodist HSA	79.1	7.3
	Sacramento	81.4	6.9
	County	01.4	0.9
	CA State	83.6	6.8

Source: CDPH, 2010-2012 *Indicates Focus Community

Data revealed that, relative to the county benchmark, a lower percentage of mothers received prenatal care in the first trimester of pregnancy in seven ZIP codes, including all six Focus Communities. The lowest percentage of prenatal care utilization was seen in ZIP code 95824 (Parkway), where 71.6% of mothers received prenatal care in the first trimester, compared to a county rate of 81.4%. Ten ZIP codes had rates of low birth weight babies above the county benchmark, including all six Focus Communities. The highest rates of low birth weight among newborns were in ZIP codes 95757 (Elk Grove) and 95828 (Florin), where 7.6% of babies have low birth weight.

Rate – Federally Qualified Health Centers per 100,000 Population

Data from the US Department of Health and Human Services for 2015 indicated that the rate of Federally Qualified Health Centers (FQHC) in the Methodist HSA is less than the state rate. The Methodist HSA rate was 1.09 FQHCs per 100,000 population, versus the state rate of 1.97 FQHCs per 100,000.

Rate – Preventable Hospital Events per 10,000 Population

The rate of preventable hospitalizations reported by the Office of Statewide Health Planning and Development for 2011 for Sacramento County was 80.23 events per 10,000 population versus the state rate of 83.17 per 10,000 population. Preventable hospital events are ambulatory care sensitive conditions which could have been prevented if adequate access to primary care was available and utilized by the community.

Rate – Mental Health Providers per 100,000 Population

Data from the US Department of Health and Human Services for 2015 reveals that the rate of mental health providers per 100,000 population was 161.2 for Sacramento County, compared to the state rate of 157.0 per 100,000 population.

Area – Health Professional Shortage Area- Mental Health

Figure 27 displays areas in the Methodist HSA that are HPSAs for mental health providers. As the figure shows, ZIP codes 95822 (Executive Airport/Meadowview), 95831 (Pocket), and 95832 (Lower Meadowview) contain areas defined as HPSAs for mental health providers.

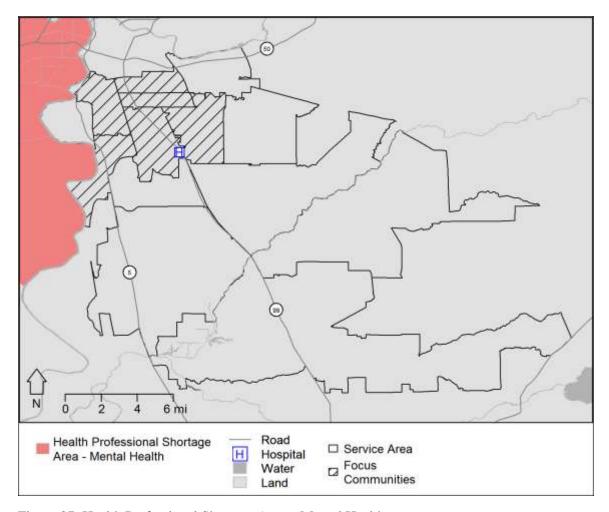

Figure 27: Health Professional Shortage Area – Mental Health

Rate – Dental Health Providers per 100,000 Population

Data from the US Department of Health and Human Services for 2015 revealed that the rate of dental health providers per 100,000 population was 71.9 for Sacramento County, compared to the state rate of 77.5 per 100,000 population.

Area – Health Professional Shortage Area- Dental Health

There were no federally designated HPSAs for dental care in the Methodist HSA. However, key informants and community members mentioned dental issues as a health concern. Many participants mentioned the need for access to dental and vision care for many adults in need of restoration services. Many community members live with missing teeth, providing a barrier to eating adequate crunchy fruits and vegetables, affecting employability and overall quality of life.

Education

Educational attainment is important for overall health and wellbeing. Education is positively associated with health status.

Percent – High School Students Graduating in Four Years

The California Department of Education reports the graduation rate as the percent of high school students receiving their high school diploma in four years. The high school graduation rate in 2013 for Sacramento County was 79.44%, slightly below the state percent at 80.44%. Rates by race and ethnicity showed that 84.1% of Whites graduate in four years compared to 68.3 % of Blacks, 72.9% of Hispanic/Latinos, 89.7% of Asians and 80.7% of non-Hispanic others. Both key informants and community members stressed the importance of access to quality education for residents of the Methodist HSA.

Percent – Adults over the Age of 25 with No High School Diploma (99) 6 mi Percent over 25 with No High School Diploma Road Focus 21.9 to 27 7.6 to 9.2 Н Hospital Communities 9.2 to 12.5 27 to 39.1 Water 12.5 to 21.9 Land

Figure 28: Percent over 25 Years Old with No High School Diploma

The percent of residents over the age of 25 without a high school diploma was 14.1% for Sacramento County and 18.8% for the state. Seven of the 14 ZIP codes had a higher percentage of residents without a diploma compared to the county benchmark, and six of these ZIP codes had rates well above the state benchmark. The highest percentages of non-graduates were in Focus Communities 95824 (Parkway) at 39.1%, 95832 (Lower Meadowview) at 36.1%, and 95828 (Florin) at 28.3%.

Percent – Non-Proficient Reading Level in Fourth Grade

Data from the California Department of Education for 2012-2014 indicated that 38% of 4th graders in Sacramento County were not proficient in reading at the 4th grade level, slightly above the state benchmark of 36%. Reading proficiency in fourth grade is important because it is linked to poverty, unemployment and barriers to healthcare access. Reading proficiency differs significantly by race and ethnicity. While 27% of White students were not proficient in reading at the 4th grade level, 53% of Black students, 49% of Hispanic/Latino students, 50% of Native American/Alaskan Native students, 47% of Native Hawaiian/Pacific Islander students, and 30% of Asian students were not proficient.

Percent – 3 and 4 Year-Olds Enrolled in Preschool

Data from the US Census Bureau for 2009-2013 indicated that 39.6% of 3 and 4 year olds in the Methodist HSA are in preschool, below the state benchmark of 49.0%. This data is important as access to early education is a social determinant of health.

Rate – Suspensions per 100 Students

The rate of suspensions as reported by the California Department of Education for Sacramento County was 6.72 suspensions per 100 students, above the state rate of 4.04 per 100 students. This is an important health indicator because it is related to educational attainment and crime in the community as an adult.

Social Services

Indicators used in this assessment to examine social services included data on the percent of population receiving services, including public insurance, Medicaid, public assistance, and percent of families eligible for free and reduced lunch.

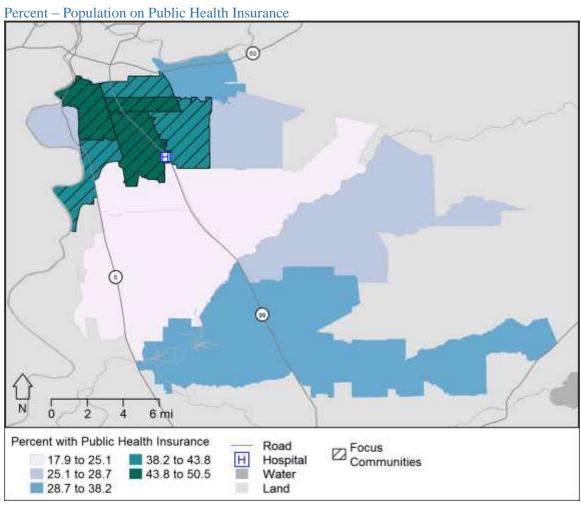

Figure 29: Percent of Population on Public Health Insurance

Data on the percent of residents with public insurance showed clear economic and access disparities. The percent of residents with public insurance was 29.5% for the state and 32.5% for Sacramento County. Seven ZIP codes within the Methodist HSA exceeded both county and state benchmarks, including all six Focus Communities. The highest percentages of residents with public insurance were in ZIP codes 95824 (Parkway) at 50.5%, 95823 (Fruitridge) at 47.1%, and 95822 (Executive Airport/Meadowview) at 44.7%.

Percent – Population Receiving Medicaid (Medi-Cal)

Though the above data provides information on the percent of population on all sources of public health insurance, the US Census Bureau reports the percent of population receiving Medicaid specifically. For the Methodist HSA, 28.3% of residents receive Medicaid, substantially above the state percent at 23.4%.

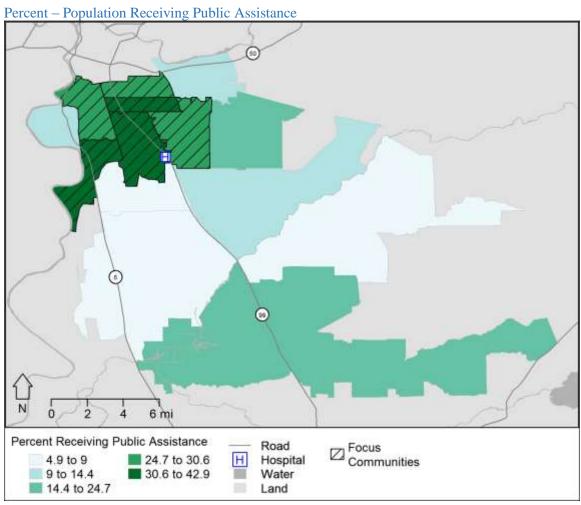

Figure 30: Percent of Population Receiving Public Assistance

The percent of population receiving public assistance varied greatly across the HSA, with seven of the 14 ZIP codes showing higher percentages than the county and state percentages. The highest rates of public assistance utilization were in Focus Communities 95832 (Lower Meadowview), 95824 (Parkway), and 95823 (Fruitridge), all drastically higher than the state benchmark of 12.1% and county benchmark of 17.1%.

Percent – Students Eligible for Free and Reduced Priced Lunch in Schools

Data from the National Center for Education Statistics in 2013-2014 indicated that 59.4% of school age children in the Methodist HSA are eligible for Free and Reduced Priced Lunch, which is above the state percent of 58.1%. This indicator is important because it identifies service needs associated with poverty, which is a social indicator of health status in a community.

PRIORITIZED DESCRIPTION OF SIGNFICANT COMMUNITY HEALTH NEEDS

The following is a list of eight significant health needs for the Methodist HSA in prioritized order. The process and method for the determination of significant health needs and the prioritization criteria follows. Each prioritized significant health needs is then detailed further with the quantitative and qualitative data that supports its inclusion.

- 1. Active Living and Healthy Eating
- 2. Access to Behavioral Health Services
- 3. Access to High Quality Health Care and Services
- 4. Disease Prevention, Management and Treatment
- 5. Basic Needs (Food Security, Housing, Economic Security, Education)
- 6. Safe, Crime and Violence Free Communities
- 7. Affordable and Accessible Transportation
- 8. Pollution-Free Living and Work Environments

Process and Methods for Prioritizing Significant Health Needs (SHN)

Potential Health Need (PHN) categories

Significant health needs were identified through an integration of both qualitative and quantitative data. The process began by generating a list of eight broad potential health needs (PHN categories) that could exist within the HSA as well as subcategories of these broad needs as applicable. The PHN categories and subcategories were identified through consideration of the following inputs: the health needs identified in the 2013 CHNA process; the categories in the Kaiser Community Commons Data Platform (CCDP) - preliminary health needs identification tool; and a preliminary review of primary data. This resulted in a list of eight PHNs for the HSA.

Quantitative/Qualitative Analysis on PHN Categories

Once the PHN categories were created, quantitative and qualitative indicators associated with each category and subcategories were identified in a crosswalk table. The potential health need categories, subcategories and associated indicators were then vetted and finalized by members of the CHNA Collaborative prior to identification of the significant health needs. A full list of the secondary indicators and primary data concepts associated with each PHN category is displayed in Appendix C.

Thresholds for Significant Health Needs (SHN)

While all potential health needs exist within the HSA to a greater or lesser extent, the purpose was to identify those that were most significant. A health need was determined to be significant through extensive analysis of the secondary and primary data for the HSA.

For the secondary (quantitative) data, indicators were flagged that compared unfavorably in size and scope of the problem to state benchmarks, or had evident disparities among racial/ethnic groups. Indicators from the CCDP were flagged if: (a) the HSA value performed poorly (>2% or 2 percentage point difference) or moderately (between 1-2% or 1-2 percentage point difference) compared to the state benchmark. Indicators sourced by Valley Vision were flagged if they compared unfavorably to benchmark by any amount as presented in Appendix C.

Prioritized Significant Health Need Identification Process

Once significant health needs were identified, they were prioritized through the following process. First, health needs were given a score based upon the degree to which they met the criteria outlined above. Health needs that met or exceeded the thresholds for both the primary (75%) and secondary (50%) data categories were given a score of two (2 points); health needs that met or exceeded the thresholds for only one of the categories were given a score of one (1 point). The health needs were then ranked so that those with two points were put into a higher tier for prioritization than those with one point.

Secondly, health needs were further ranked within their tiers based upon additional analysis of the primary data. As previously mentioned, the interview guide for primary data collection prompted participants to identify the health issues in their communities that were salient to them and most urgent/important to address. Thematic analysis was conducted on the responses to this question and matched with the significant health need categories. The percentage of sources referring to each health need as a priority was calculated from this analysis, and then used for further prioritization of the health needs within tiers. Health needs with a higher percentage of sources were ranked above those with a lower percentage of sources identifying that health need as a priority.

Prioritized Significant Health Needs for Methodist Hospital of Sacramento

Table 31 displays the full results of data synthesis to identify and prioritize the significant health needs for Methodist HSA. Each prioritized health need is listed with the corresponding secondary and primary data which led to its determination as a need.

Table 31: Prioritization of Significant Health Needs with Data Scoring and Ranked by Importance

	Methodist Hospital of Sacramento (N=39)				
	RANK	Significant Health Needs	QUANT	QUAL	IMPORTANCE
			50%	75%	
	1	Active Living and Healthy Eating	76%	97%	49%
	2	Behavioral Health	71%	95%	46%
T: 2	3	Access to Care	76%	92%	33%
Tier 2	4	Disease Prevention/Management	70%	85%	31%
	5	Basic Needs	57%	97%	21%
	6	Safe Communities	75%	95%	15%
Tion 1	7	Transport	67%	59%	5%
Tier 1	8	Pollution Free Communities	83%	44%	0%

Tier 2 signifies that a health need met both the quantitative and qualitative thresholds. The health needs in tier 2 were then sorted by percent importance.

Tier 1 signifies that a health need met one of the quantitative or qualitative thresholds. The health needs in tier 1 were then sorted by percent importance.

1. Active Living and Healthy Eating

This category includes all components of healthy eating and active living including health behaviors (e.g. fruit and vegetable consumption), associated health outcomes (e.g. diabetes) and aspects of the physical environment/living conditions (e.g. food deserts). The category does <u>not</u> include food security, which is a component of the Basic Needs category.

Quantitative Indicators

- Physical Inactivity -- Adults
- Heart disease ED visits
- Heart disease hospitalizations
- Diabetes Management
- Diabetes Prevalence
- Fruit and vegetable expenditures
- Colorectal cancer ED visits
- Colorectal cancer incidence
- Diabetes ED visits
- Diabetes—Hospitalizations
- Diabetes-- Mortality
- USDA defined food desert
- Hypertension ED visits
- Hypertension hospitalizations
- Commuting to work walking
- Percent breastfeeding
- Soda expenditures
- Osteoporosis ED visits
- Osteoporosis hospitalizations
- Low fruit and vegetable consumption youth
- Grocery stores per population
- Overweight youth

Qualitative Themes

- Lack of access to healthy affordable foods in the community
- Food deserts in low SES communities
 - Lack of grocery stores with quality fruits and vegetables
 - Abundance of unhealthy food options
- Need for health education related to physical activity and healthy eating
- Healthy eating is perceived to be cost prohibitive, especially when feeding a family
- Community members desire to be more physically active and to have access to safe public parks
- Need for more walkable communities including safer sidewalks, bike lanes and improved urban design/built environment when planning new communities
- Barriers related to healthy eating include:
 - Lack of time for buying and preparing nutritionally dense food
 - o Differences in cultural food practices
 - Lack of motivation related to competing priorities
- Barriers related to active living include:
 - Lack of trees and heat
 - Use of technology/screen time
 - Lack of transportation to gyms and recreation facilities
 - Lack of time
 - Lack of motivation to exercise considering daily stressors
 - Cultural barriers related to exercise

2. Access to Behavioral Health Services

This category encompasses the following needs related to behavioral health:

- Access to mental health and substance abuse prevention and treatment services
- Tobacco education, prevention and cessation services
- Social engagement opportunities (especially for youth and seniors)
- Suicide prevention

This category includes health behaviors (e.g. substance abuse), associated health outcomes (e.g. COPD) and aspects of the social and physical environment (e.g. social support and access to liquor stores). In addition, this category includes life expectancy since persons with severe mental health issues may have a lower life expectancy.

Quantitative Indicators

- Alcohol consumption
- Alcohol expenditures
- Tobacco expenditures
- Smoking prevalence
- Lung Cancer -- ED visits
- Lung Cancer incidence
- Substance abuse -- ED visits
- Substance abuse-Hospitalizations
- COPD ED visits
- COPD Hospitalizations
- Life expectancy at birth
- Poor mental health days
- Mental health -- ED visits
- Mental health -- hospitalizations
- Self-Inflicted Injury ED visits
- Suicide Mortality

- Substance use, including:
 - -Tobacco and e-cigarette use
 - -High rates of opiate prescription drug use (used by individuals other than who the drugs were prescribed for and/or used at higher doses than prescribed)
- Those with mental health issues may use substances to cope with mental health symptoms; discussion that there may be a connection between mental health and substance use issues
- Concerns that area parks and other public places are not safe to utilize due to safety concerns related to individuals using illicit drugs
- There is a need for social engagement and support for those with mental health and substance use issues
- There are limited resources for trauma informed pediatric mental health care that considers adverse childhood experiences
- Daily stress creates significant challenges
- Serious mental illness and chronic mental health issues such as depression, anxiety and schizophrenia were discussed as being significant in this HSA
- There is a need for culturally sensitive mental health and substance use care
- There are limited services and/or a lack of capacity of providers
- Homelessness was discussed as a significant issue in this HSA. It was suggested that mental health and substance use issues may be connected to homelessness
- Elderly mental health was discussed related to Alzheimer's and dementia
- Those struggling with mental health and substance use issues have challenges meeting basic needs such as housing, gainful employment, food and safety
- Emergency department care was challenging for consumers and service providers, especially related to 5150 holds

3. Access to High Quality Health Care and Services

This category encompasses the following needs related to access to care:

- Access to Primary and Specialty Care
- Access to Dental Care
- Access to Maternal and Infant Care
- Health Education & Literacy
- Continuity of Care, Care Coordination & Patient Navigation
- Linguistically & Culturally Competent Services

This category includes health behaviors that are associated with access to care (e.g. cancer screening), health outcomes that are associated with access to care/lack of access to care (e.g. low birth weight) and aspects of the service environment (e.g. health professional shortage area). The category does <u>not</u> include access to mental health providers, which is a component of the Access to Behavioral Health Services category.

Quantitative Indicators

• Cancer screening – Mammogram

- Cancer screening Pap
- 3 and 4 year olds in school
- Percent of population on public insurance
- Percent of population receiving Medicaid
- Percent breastfeeding
- Soda expenditures
- Access to dentists
- Federally Qualified Health Centers
- Dental Issues ED visits
- Dental Issues hospitalizations
- HPSA Primary Care
- Infant mortality rate
- Percent receiving prenatal care
- Teen pregnancy rate
- Low Birth Weight

Qualitative Themes

- Access to a provider is hard for low SES communities especially related to primary, specialty care, maternal and child health care and oral health care
- The Affordable Care Act insured low income communities but coverage provided doesn't equal access to care. Long waits to see providers and substandard care persists
- Medi-Cal providers are hard to find and retain
- There are limited providers and long wait times to see a
 primary care provider, especially in low income communities.
 It is not uncommon for those waiting to utilize the ED multiple
 times while waiting weeks/months to see primary care
 providers
- Language barriers between provider and patient create significant access issues
- Prescription drugs and certain prescribed treatments are cost prohibitive
- Undocumented residents experience severe barriers in accessing care
- Coordinated care is important especially related to transportation to health care services, the ability to access multiple services in one location and the ability to access culturally sensitive care
- Emergency departments are overwhelmed and over utilized
- Transportation to health care is challenging for many individuals
- Dental and vision care are difficult to access for low SES communities

4. Disease Prevention, Management and Treatment

This category encompasses the following health outcomes that require disease prevention and/or management measures as a requisite to improve health status:

- Cancer: Breast, Cervical, Colorectal, Lung, Prostate
- CVD/Stroke: Heart Disease, Hypertension, Renal Disease, Stroke
- HIV/AIDS/STDS: Chlamydia, Gonorrhea; HIV/AIDS
- Asthma

This category includes health behaviors that are associated with chronic and communicable disease (e.g., fruit/vegetable consumption, screening), health outcomes that are associated with these diseases or conditions (e.g. overweight/obesity), and associated aspects of the physical environment (e.g. food deserts).

Quantitative Indicators

- Adult physical inactivity
- Alcohol consumption
- Alcohol expenditures
- Cancer screening Mammogram
- Cancer screening Pap
- Tobacco expenditures
- Smoking prevalence
- Heart disease ED visits
- Heart disease –
 hospitalizations
- Asthma prevalence
- Asthma ED visits
- Asthma hospitalizations
- All cause cancer mortality
- Lung cancer ED visits
- Lung cancer incidence
- Diabetes Management
- Diabetes Prevalence
- Fruit and vegetable expenditures
- Overweight Youth
- Colorectal cancer ED visits
- Colorectal cancer incidence
- Diabetes ED visits
- Diabetes--Hospitalizations
- USDA defined food desert
- Hypertension ED visits
- Hypertension--Hospitalizations
- Cervical cancer incidence
- Breast cancer ED visits
- Breast cancer incidence
- Stroke mortality
- Hypertension mortality
- Chlamydia incidence

- Cardiovascular disease and stroke were the most commonly mentioned conditions in the community
- There were high rates of asthma and respiratory issues in the HSA
- There were significant concerns with smoking and the use of other tobacco products, especially related to asthma
- Breast, stomach, lung, skin, prostate, leukemia and cervical cancers were discussed. Residents were concerned about environmental toxins being related to the development of cancer. Certain residents had been previously exposed to toxins through Chernobyl
- Sexually transmitted infections (STI) were discussed including HIV/AIDS, Hepatitis C and syphilis. There is concern about the stigma associated with contracting and/or living with an STI
- Transportation was discussed as a significant barrier related to all conditions presented above

- Gonorrhea incidence
- Prostate cancer ED visits
- Sexually transmitted infections ED visits
- HIV—ED visits
- Stroke ED visits
- Stroke hospitalizations
- Pollution Burden Score

5. Basic Needs (Food Security, Housing, Economic Security, Education)

This category encompasses the following basic needs:

- Economic security (income, employment, benefits)
- Food security/insecurity
- Housing (affordable housing, substandard housing)
- Education (reading proficiency, high school graduation rates)
- Homelessness

Quantitative Indicators

- 3 and 4 year olds in school
- Percent of population on public insurance
- Percent of population receiving Medicaid
- Life expectancy at birth
- High school graduation rate
- Reading Proficiency
- Food Insecurity
- Population with SNAP
- School suspensions
- Percent unemployed
- Free and Reduced Price Lunch
- Percent Below 100% of the Federal Poverty Level

- There are challenges in accessing affordable housing. Homelessness is of significant concern, especially for homeless individuals accessing health services for substance use and mental health issues
- The need for coordinated service delivery of basic needs for impoverished residents was discussed
- There is a great desire for smoke-free rental housing
- Gentrification is presenting concerns, especially in Oak Park
- Many residents struggle with accessing food, especially homeless individuals. Residents struggle with the affordability of healthy food, especially in food deserts
- Community members worry about the shame and stigma associated with accessing food closets and banks
- Residents desire additional grocery stores, especially in lower socioeconomic areas
- Quality education is challenging to find in lower socioeconomic areas
- Adults without a GED/high school diploma struggle with economic security. Those with higher education degrees also struggle with job placement
- Vocational training is desired in this HSA

6. Safe, Crime and Violence Free Communities

This category includes safety from violence and crime including violent crime, property crimes and domestic violence. This category includes health behaviors (e.g. assault), associated health outcomes (e.g. mortality - homicide) and aspects of the physical environment (e.g. access to liquor stores). In addition, this category includes factors associated with unsafe communities such as substance abuse and lack of physical activity opportunities, and unintentional injury such as motor vehicle accidents.

Quantitative Indicators

- Adult physical inactivity
- Alcohol consumption
- Alcohol expenditures
- Substance Abuse ED visits
- Substance Abuse hospitalizations
- Homicide mortality
- Fatal pedestrian accidents
- Assault ED visits
- Assault hospitalizations
- Major crime rates
- Unintentional injuries –
 ED visits
- Unintentional injuries hospitalizations

Qualitative Themes

- Gang violence including shootings, high speed chases, drug sales and robberies were discussed, especially in Del Paso Heights, Citrus Heights, North Sacramento and Arden-Arcade
- Domestic violence and sexual assault were discussed. There
 are limited resources and shelter beds for victims of domestic
 violence. Domestic violence is thought to be connected to
 child abuse/neglect and other family violence issues
- Communities are struggling with frequent gun and knife violence which created specific safety concerns for children and elderly residents
- Alcohol and other substance abuse affect the community and contribute to crime, violence and mental health issues
- Child abuse and trauma are of concern in this HSA
- Tension with the police have created challenges for residents in feeling comfortable accessing law enforcement services, especially in low socioeconomic communities.

7. Affordable and Accessible Transportation

This category includes the need for public or personal transportation options, transportation to health services and options for persons with disabilities.

Quantitative Indicators

- Population living near a transit stop
- Commuting to work by walking
- Commuting to work alone
- Population with a disability

- Public transportation is expensive, difficult to access and not always reliable
- Residents do not always feel safe on public transportation
- Rural areas struggle significantly with access to public transportation
- Many residents live far from their jobs and may not have access to cars
- Residents struggle with transportation to medical appointments and procedures
- Social services and grocery stores are not always located near public transportation

8. Pollution-Free Living and Work Environments

This category includes measures of pollution such as air and water pollution levels. This category includes health behaviors associated with pollution in communities (e.g. physical inactivity), associated health outcomes (e.g. COPD) and aspects of the physical environment (e.g. road network density). In addition, this category includes tobacco usage as a pollutant. The category does <u>not</u> include climate related factors such as drought and heat stress.

Quantitative Indicators

- Adult physical inactivity
- Tobacco expenditures
- Smoking prevalence
- Heart disease ED visits
- Heart disease hospitalizations
- Asthma prevalence
- Asthma ED visits
- Asthma hospitalizations
- Cancer mortality
- Road Density
- Low Birth Weight
- Pollution Burden Score
- Population living near a transit stop
- COPD ED visits
- COPD hospitalizations

- Asthma, COPD and respiratory allergies are major issues for area residents
- Residents are concerned about the consumption of tobacco and marijuana in communal living environments
- Pests, including cockroaches, mice, rats, fleas, bedbugs, and ringworm, create health issues and allergic reactions
- Residents are concerned about the health impacts of pesticide spraying in their neighborhoods

RESOURCES POTENTIALLY AVAILABLE TO MEET SIGNIFICANT HEALTH NEEDS

One hundred and fifty-eight resources were identified in the Methodist HSA. The method included starting with the list of resources from the 2013 Methodist Hospital CHNA, verification that the resource still existed, and adding newly identified resources in the primary data for the 2016 CHNA report. Examination of the resources revealed the following numbers of resources for each significant health need:

Table 32: Number of Resources for Each Significant Health Need in Prioritized Order

Significant Health Need (in priority order)	Number of resources
1. Active Living and Healthy Eating	39
2. Access to Behavioral Health Services	69
3. Access to High Quality Health Care and Services	69
4. Disease Prevention, Management and Treatment	28
5. Basic Needs (Food Security, Housing, Economic Security, Education)	68
6. Safe, Crime and Violence Free Communities	35
7. Affordable and Accessible Transportation	3
8. Pollution-Free Living and Work Environments	4

For more specific examination of resources by significant health need and by geographic locations, see the full list in Appendix H.

IMPACT OF ACTIONS TAKEN SINCE 2013 CHNA

Methodist Hospital of Sacramento is experiencing positive outcomes for programs and initiatives addressing priority health issues identified in the preceding 2013 Community Health Needs Assessment (CHNA). These programs and initiatives continue to align with many of the priority health needs identified in the new 2016 CHNA and will continue to be supported by the hospital. They are highlighted below, within the newly defined 2016 priority health need categories. FY 2015 Dignity Health Community Grant collaborations are denoted by *. All outcomes are reflective from FY 2013 through FY 2015 unless otherwise noted.

Active Living and Healthy Eating

<u>Food Literacy Center</u> - The hospital supports this organization's efforts to teach literacy and nutrition through cooking classes at underserved elementary schools. The center offers strategies to create behavior change and prevent childhood obesity through two core programs, which together provide a complete, scalable and replicable solution to the problem: 1) teaching food literacy to low-income pre-K through 6th graders, and 2) training community members as food literacy instructors.

FY 2014-2015 Outcomes:

• 840 children across 7 schools attended a food literacy class FY 2014-2015 Expenses: \$5,000 shared by Dignity Health hospitals in Sacramento County

<u>WayUp Station*</u> - Through the Community Grants Program, the WayUp Station in partnership with WayUp Sacramento, Sacramento Covered and WellSpace Health places a community-based educational resource center in an underserved community. The primary purpose of the collaborative is to expand access to health-related resources and other social services including nutrition and exercise.

FY 2015 Outcomes:

• 180 community residents received services through the collaborative partners FY 2015 Expenses: \$150,000 shared by Dignity Health hospitals in Sacramento County

<u>Mack Road Partnership</u> – In FY 2015, Methodist Hospital partnered with Mack Road Partnership who provides access to affordable fresh healthy food options to residents in south Sacramento who would otherwise not have access to fresh foods. The partnership will also bring new resource connections to the Partnership's Community Center. The hospital contributes market match funds which double dollar for dollar the quantity of local farmer's market produced that can be purchased by Cal Fresh recipients who attend.

FY 2015 Expenses: \$5,000

Access to Behavioral Health Services

<u>ReferNet Intensive Outpatient Mental Health Partnership</u> - The hospital works in collaboration with community-based nonprofit mental health provider, El Hogar, to provide a seamless process for patients admitting to the emergency department with mental illness to receive immediate and ongoing treatment and other social services they need for a continuum of care when they leave the hospital.

Outcomes:

- Over 900 patients were referred to program through hospital social workers; 372 successfully received intensive outpatient treatment and were referred to other social service resources as needed.
- Of the patients who successfully received services, there was a nearly 58% decrease in ED visits when comparting ED utilization three months pre versus three months post intervention

Expenses: \$286,285 shared by Dignity Health hospitals in Sacramento County

<u>Navigation to Wellness*</u> - This initiative engages nonprofit mental health provider, Turning Point, to improve the quality of care for patients in mental health crisis. Clinical social workers from Turning Point work side by side hospital social workers to ensure patients are linked to appropriate public and community behavioral health services needed for wellness when they are discharged. The collaboration includes the following community partners: Crime Victims Assistance Network (I-CAN) Foundation; Consumers Self Help Center; and My Sister's House.

FY 2015 Outcomes:

• Services for this collaboration started in March of 2015. Within the first four months, over 140 patients were linked to community resources at the time of emergency department discharge and received follow-up care over 30 days to ensure they connected to the resources.

FY 2015 Expenses: \$300,000 shared expense by Dignity Health hospitals in Sacramento County

Mental Health Improvement Coalition - Methodist Hospital and other Dignity Health hospitals in Sacramento County joined with Sutter Health, Kaiser Permanente, and UC Davis Health Center in FY 2015 to develop strategies for improving the delivery of mental health services and access to care in Sacramento County. Significant improvements to date have included County approval for expanded crisis residential services and crisis stabilization services.

FY 2015 Outcomes:

- Total County budget increase of \$28.4M to support:
 - o Expanding County Crisis Stabilization Unit with some open access anticipated
 - o 3 new 15-bed crisis residential treatment centers
 - o Mental health urgent care center
 - o Increased funding for community outpatient services

FY 2015 Expenses: \$75,000 which is a shared expense by Dignity Health hospitals in Sacramento County

<u>Mental Health Consultations and Conservatorship Services</u> - The hospital provides psychiatric consultations at no cost for all patients who require evaluations while hospitalized, as well as patient conservatorship services to those who lack capacity or family help to make decisions. Outcomes:

• 18,717 persons served

Expenses: \$6,114,297 shared by Dignity Health hospitals in Sacramento County

Access to High Quality Health Care and Services

<u>Patient Navigator Program</u>- Patient navigators in the hospital's emergency department connect patients seen and treated at the hospital to medical homes at community health centers and provider offices throughout the region. The Patient Navigator Program represents a unique collaboration between Health Net, a Medi-Cal Managed Care insurance plan, Sacramento Covered, a community-based nonprofit organization, and community clinics in the region.

FY 2014-2015 Outcomes:

- 8,932 patients were assisted
- 76% of the patients had a follow up appointment scheduled with a Primary Care or other type of provider
- Outcomes show a decrease in emergency department primary care visits by over 50% and urgent care visits by 44% when comparing pre and post ED utilization

Expenses: \$824,369 shared by Dignity Health hospitals in Sacramento County

<u>Cancer Nurse Navigator</u> - This hospital program is designed to help patients navigate the maze of options related to cancer and to complement and enhance services provided by physicians. Nurses work to improve continuity of care, enhance patient/doctor communication whenever an abnormality shows up on mammogram, breast ultrasound, or breast MRI, as well as information to the community about financial assistance for breast cancer screening. Patients receive information, resources, and support for assisting with biopsies. Education about pathology results and assistance obtaining referrals to specialists is provided in a timely manner. The navigators also coordinate a group of peer support volunteers who are matched up with patients newly diagnosed with breast cancer.

FY 2014-2015 Outcomes:

• 5,221 persons received support or education through outreach and engagement events-- shared by Dignity Health hospitals in Sacramento and Yolo counties.

Expenses: \$128,890 shared by Sacramento County and Yolo County Dignity Health hospitals

<u>WellSpace Health Expansion for Women</u> – In FY 2015, Methodist and WellSpace Health worked collaboratively to save a women's health care clinic on the hospital campus that was at risk of closing. The transition to WellSpace Health enabled the clinic to remain open and continue providing prenatal and OB/GYN services largely for low-income families.

FY 2015 Expenses: \$100,000

Mercy Family Health Center - A part of the Family Practice Residency Program, the hospital's Mercy Family Health Center provides care and treatment to this underserved community. The health center continues to increase capacity, and has expanded services at other locations in the community, including Sacramento Loaves & Fishes and community clinics. Residency physicians are actively involved in training to provide trauma informed patient care for victims of human trafficking and domestic violence, and to address the unique healthcare needs of the chronically homeless. Residency Physicians are also involved with the Elk Grove School District's Adopt a School program and assist with physicals. Outcomes:

• Mercy Family Health Center provided care and treatment to 50,103 underserved patients.

Expenses: 9,274,430

<u>SPIRIT</u> - The Sacramento Physicians' Initiative to Reach Out, Innovate and Teach (SPIRIT) operated under the Sierra Sacramento Valley Medical Society exists as a vehicle to involve physicians in the community. SPIRIT recruits and places physician volunteers in local clinics to provide free specialty medical care to the uninsured and coordinates and case manages surgical procedures donated at local hospitals and ambulatory surgery centers.

Outcomes:

• 81 patients received free surgical services provided at a Dignity Health surgical center, and performed by Dignity Health affiliated physicians.

Expenses: \$45,000 shared by Dignity Health hospitals in Sacramento County.

Other Access to Care Services:

- School Nurse Program Nearly 2,000 students and family members received health services annually within the Catholic Diocese of Sacramento through the hospital's School Nurse program. Services include health care and mandated health screenings.
- Mercy Faith and Health Partnership This interfaith community outreach program supports the development of health ministry programs focused on promoting good health and disease prevention in local faith communities
- Financial assistance for uninsured/underinsured and low income residents The hospital provides discounted and free health care to qualified individuals, following Dignity Health's Financial Assistance Policy.

Disease Prevention, Management and Treatment

<u>Healthier Living</u> - Based on the Stanford University evidence-based model, these Chronic Disease Self-Management (CDSMP) and Diabetes Self-Management Programs are offered at the community level in partnership with clinics, food banks, low-income housing developments and others to ensure the underserved have access.

Outcomes:

- 62 CDSMP and Diabetes workshops were conducted in both English and Spanish with a total of 508 participants completing the program.
 - On average, less than 10% of the completers readmitted to the hospital within three months of completing the workshop.
- As of the end of FY2015, there were 27 active lay leaders; six of which are Spanish speaking and seven are certified master trainers in the region

Expenses: \$54,939 shared by Dignity Health hospitals in Sacramento County

<u>CHAMP®</u> (Congestive Heart Active Management Program) - This unique program keeps individuals with heart disease connected to the medical world through symptom and medication monitoring and education. CHAMP® establishes a relationship with patients who have heart disease after discharge from the hospital through: 1) Regular phone interaction to help support and educate patients in managing their disease; 2) Monitoring of symptoms or complications and recommendations for diet changes, medicine modifications or physician visits.

Outcomes:

• 13,392 patients served across the four Sacramento hospitals and less than 2% of the patients served admitted to the emergency department three months post intervention.

Expenses: \$1,041,102 shared by Dignity Health hospitals in Sacramento County

Basic Needs (Food & Economic Security, Housing and Education)

Homeless Outreach Project* - Through the Community Grants Program, the hospital is collaborating with Sacramento Steps Forward, Sacramento Loaves & Fishes, TLCS, and the Downtown Sacramento Foundation on an outreach program for chronically homeless individuals. Using a central intake method, the collaborative partners work with social work to connect with patients experiencing homelessness while they are in the hospital and then develop a care plan that links them with community resources based on their needs. This collaborative also addresses access to behavioral health services. Outcomes:

- 639 individuals experiencing homelessness were served by one or more of the partners
 - o 339 clients where engaged in Mental Health services, 66 clients were placed in safe shelter, 22 clients where placed in Substance abuse treatment, 25 clients enrolled in Health Care benefits, 60 clients engaged with Primary Care, 60 clients secured an income, 74 clients secured ID and SS cards, 23 clients secured Birth Certificates, 5 clients secured the needed DD214 verification of duty in the Armed Forces.

FY 2015 Expenses: \$230,204 shared by Dignity Health hospitals in Sacramento County

<u>Interim Care Program</u> - The hospital is an active partner in the Interim Care Program (ICP). This collaborative engages other Dignity Health hospitals and health systems in the region, the Salvation Army, Sacramento County and Federally Qualified Health Center, WellSpace Health, and provides a respite care shelter for homeless patients with available physical and mental health, and substance abuse treatment.

Outcomes:

- 280 patients referred by Dignity Health hospitals in Sacramento County were enrolled into the program
- Average length of stay = 26.3 days

Expenses: \$432,960 shared by Dignity Health hospitals in Sacramento County

Housing First Homeless Program - In partnership with Lutheran Social Services, Methodist Hospital established a Housing First Homeless Program in FY 2015 that aims to assist homeless individuals with severe chronic health and mental health issues obtain and retain housing, care and services designed to achieve stability in their lives. Hospital case managers work directly with Lutheran Social Services staff to identify participants who will be housed in supportive living apartments and receive intensive case management and supportive services. Ongoing health care for these participants is provided by the Mercy Family Health Center or their medical home and Mercy Home Care, with the goal of transitioning participants into permanent housing.

Outcomes:

- 15 patients were enrolled into the Housing with Dignity program
 - Of the patients served, there was a 58% reduction in inpatient admissions to the hospital, a 45% decrease in emergency department utilization, and a 76% reduction in total days spent in the hospital.

Expenses: \$150,000 shared by Dignity Health hospitals in Sacramento County

Safe, Crime and Violence Free Communities

Safe Kids Program - Child death due to vehicle accidents is one of the leading causes of death in Sacramento County for families living in poverty, particularly within the Russian, Hmong and Spanish immigrant communities, largely due to lack of appropriate car restraints and education. The Safe Kids program provides free car seats and educational classes in the community and to all leaving the hospital with a newborn infant. The hospital provides this service at no cost to families with children living in poverty and to families with children in immigrant communities, where the need is greatest. Car seat

classes are a part of this core hospital program. Safe Kids health and safety fairs are part of the overall Safe Kids program sponsored by the hospital.

Outcomes:

• 1,774 individuals received a car seat or had their car seat checked and/or attended an educational class

<u>Human Trafficking</u> - The initial phase of this initiative launched in FY 2015 with a core emergency response team established and the roll out of the first phase of education and training to hospital clinical staff to increase awareness and improve quality of care for human trafficking victims. The development of a strategic plan that engages community resources is underway in partnership with several nonprofit organizations, law enforcement and the Sacramento County Justice Department.

<u>Weave Wellness Center</u> - Established by the hospital, the center is located on campus and offers triage, intake, mental health and counseling services, education, case management and other support services including safe housing to victims of domestic violence and sexual assault.

Outcomes:

• 810 individuals were served by Weave, with support services addressing the effects of domestic violence and sexual assault.

Expenses: \$150,000

<u>Initiative to Reduce African American Child Deaths</u> - Methodist Hospital and Dignity Health hospitals in Sacramento County are taking a leading role in the region to ensure children have a safe sleeping environment by providing appropriate cribs, assessments and education in partnership with the Sacramento County Child Abuse Center. The hospital is also represented on the Sacramento County Steering Committee on Reduction of African American Child Deaths, which is chartered to develop strategy and oversight for all county-wide efforts to reduce child deaths among this target population between 10 and 20 percent by 2020. African American children die at a rate that is twice that of all other children in Sacramento County.

CONCLUSION

Nonprofit hospitals play an important role in the lives of the communities they serve. CHNAs help nonprofit hospitals, as well as other community organizations, in determining where to focus community benefit and improvement efforts, including geographic locations and specific populations living in their service areas. The intention of the CHNA is to assist in improving the lives of hospital service area residents, and the larger geographical area served. Results provided in this assessment will help inform efforts with work towards improving the health of a community and better addressing specific target populations with significant health and health-related disparities.

Appendix B: Secondary Data Dictionary and Processing

Introduction

The secondary data supporting the 2016 Community Health Needs Assessment was collected from a variety of sources, and was processed in multiple stages before it was used for analysis. This document details those various stages. Approaches used to define ZIP code boundaries, and the approaches that were used to integrate records reported for PO boxes into the analysis are described. General data sources are listed, followed by a description of the basic processing steps applied to most variables and concluding with detail on additional specific processing steps used to generate a subset of more complicated indicators.

ZIP Code Definitions

All morbidity and mortality variables collected in this analysis are reported by patient mailing ZIP codes. ZIP codes are defined by the US Postal Service as a single location (such as a PO Box), or a set of roads along which addresses are located. The roads that comprise such a ZIP code may not form contiguous areas, and do not match the approach of the US Census Bureau, which is the main source of population and demographic information in the US. Instead of measuring the population along a collection of roads, the Census reports population figures for distinct, contiguous areas. In an attempt to support the analysis of ZIP code data, the Census Bureau created ZIP Code Tabulation Areas (ZCTAs). ZCTAs are created by identifying the dominant ZIP code for addresses in a given Census block (the smallest unit of Census data available), and then grouping blocks with the same dominant ZIP code into a corresponding ZCTA. The creation of ZCTAs allows us to identify population figures that, in combination with the morbidity and mortality data reported at the ZIP code level, allow for the calculation of rates for each ZCTA. The difference in the definition between mailing ZIP codes and ZCTAs has two important implications for analyses of ZIP code level data.

First, it should be understood that ZCTAs are approximate representations of ZIP codes, rather than exact matches. While this is not ideal, it is nevertheless the nature of the data being analyzed. Secondly, not all ZIP codes have corresponding ZCTAs. Some PO Box ZIP codes or other unique ZIP codes (such as a ZIP code assigned to a single facility) may not have enough addressees residing in a given census block to ever result in the creation of a ZCTA. However, residents whose mailing addresses correspond to these ZIP codes will still show up in reported morbidity and mortality data. This means that rates cannot be calculated for these ZIP codes individually because there are no matching ZCTA population figures.

In order to incorporate these patients into the analysis, the point location (latitude and longitude) of all ZIP codes in California²⁸ were compared to ZCTA boundaries²⁹. Because various morbidity and mortality data sources were available in different years, this comparison was made between the ZCTA boundaries and the point locations of ZIP codes in April of the year (or the final year in the case of variables aggregated over multiple years) for which the morbidity and mortality variables were reported. All ZIP codes (whether PO Box or unique ZIP code) that were not included in the ZCTA dataset were identified. These ZIP codes were then assigned to either ZCTA that they fell inside of, or in the case of rural areas that are not completely covered by ZCTAs, the ZCTA to which they were closest. Morbidity and mortality information associated with these PO Box or unique ZIP codes were then added to the ZCTAs to which they were assigned.

Data Sources

The majority of mortality, morbidity, and socio-economic variables were collected from three main data sources: the US Census Bureau (Census), the California Office of Statewide Health Planning and Development (OSHPD), and the California Department of Public Health (CDPH). Census data was collected to provide both descriptions of population characteristics for the study area, and to calculate rates for morbidity and mortality variables. Table 33 below lists the 2013 population characteristic variables and sources. Table 34 below lists sources for variables used to calculate morbidity and mortality rates, which were collected for 2012, 2013, and 2014. These demographic variables were collected variously at the Census blocks and tracts, ZCTA, county, and state levels. In urban areas, Census blocks are roughly equivalent to a city block, and tracts to a neighborhood. Health outcome and health behavior indicators were also collected from the Kaiser Permanente Community Commons Data Platform (CCDP) to compliment the indicators already collected from other sources.

Kaiser Permanente Community Commons Data Platform (CCDP)

The CCDP is a web-based platform designed to assist hospitals, non-profit organizations, state and local health departments, financial institutions and other organizations seeking to better understand the needs and assets of their communities. The CCDP was used to collect additional indicators, including indicators by race and ethnicity, in order to better understand the drivers of health in the community and prioritize issues that require the most urgent attention. The list of CCDP indicators used is detailed below in Table 37, Remaining Secondary Indicators.

Table 33: Demographic Variables Collected from the US Census Bureau³⁰

Collected morbidity and mortality data included the number of emergency department (ED) discharges, hospital (H) discharges, and mortalities associated with a number of conditions, as well as various cancer and STI incidence rates. Aggregated 2011 – 2013 ED and H discharge data were obtained from the Office of Statewide Health Planning and Development (OSHPD). Table 35 lists the specific variables collected by ZIP code and county. These values report the total number of ED or H discharges that listed the corresponding ICD9 code as either a primary or any secondary diagnosis, or a principle or other E-code, as the case may be. In addition to reporting the total number of discharges associated with the specified codes per ZIP code/county, this data was also broken down by sex (male and female), age (less than 1 year, 1 to 4 years, 5 to 14 years, 15 to 24 years, 25 to 34 years, 35 to 44 years, 45 to 54 years, 55 to 64 years, 65 to 74, 75 to 84 years, and 85 years or older), and normalized race and ethnicity (Hispanic of any race, non-Hispanic White, non-Hispanic Black, non-Hispanic Asian or Pacific Islander, non-Hispanic Native American.

Table 35: 2011 – 2013 OSHPD Hospitalization and Emergency Department Discharge Data

Category	Variable Name	ICD9/E-Codes
	Breast Cancer	174, 175
Comoon	Colorectal Cancer	153, 154

Other	Oral cavity/Dental	520-529
	Osteoporosis	733

Mortality data, along with some birth data, for each ZIP code in 2010, 2011, and 2012 were collected from the California Department of Public Health (CDPH). The specific variables collected are defined in Table 36. The majority of these variables were used to calculate specific rates of mortality for 2012. A smaller number of them were used to calculate more complex derived indicators. To increase the stability of these derived indicators, rates were calculated using data from 2010 to 2012. These variables include the total number of live births, total number of infant deaths (ages less than 1 year), all-cause mortality by age, births with low infant birth weight, and births with mother's age at delivery under 20. Table 36 consequently also lists the years for which each variable was collected.

_

Nephritis, Nephrotic Syndrome and Nephrosis	N00-N07, N17-N19, N25-N27	2012
All Other Causes	Residual Codes	2012
Total Births		2010 - 2012
Births with Infant Birthweight Under 1500 Grams, 1500-2499 Grams		2010 - 2012
Births with Mother's Age at Delivery Under 20		2010 - 2012

Cancer incidence data were obtained from the California Cancer Registry for each ZIP code. The data reported the total aggregated incidence of cancers from 2010 - 2012 for breast, colorectal, lung, and prostate cancers. ZIP codes with more than zero but fewer than three cases were masked. For processing purposes, these masked values were treated as zeroes.

Chlamydia and gonorrhea incidence data for 2014 were obtained from the County Public Health offices in El Dorado, Placer, Sacramento, and Yolo counties. The incidence data were reported by 2014 ZCTA per 10,000 population. A number of steps were taken to process these variables due to differences in reporting geography and data provided. First, some counties provided pre-calculated rates, while others provided raw counts by ZIP code. Second, some counties provided data for all ZIP codes, while others provided only data for those with reported cases exceeding a certain masking standard. Finally, because ZIP codes can cross county boundaries, each county health office provided only information on the cases that occurred in ZIP codes within their respective counties.

The following approaches were applied to address these irregularities. First, pre-calculated rates were only used for those counties for which raw counts were not reported. Second, a consistent standard to mask rates for ZIP codes with 5 or fewer cases was applied across all counties reporting raw counts, and for counties only reporting rates for a subset of ZIP codes (i.e. Sacramento County), it was assumed that

counties for which data was not reported had 0 incidence rates. For ZIP codes that fell within multiple counties providing data, these cases were simply totaled for the given ZIP code. For ZIP codes that fall partially outside of the counties reporting data, the calculated rates are based only on cases occurring within the reporting counties.

The remaining secondary variables were collected from a variety of sources, and at various geographic levels. Table 37 lists the sources of these variables, and lists the geographic level at which they were reported.

General Processing Steps

Rate Smoothing

All OSHPD, as well as all single-year CDPH, variables were collected for all ZIP codes in California. The CDPH datasets included separate categories that included either patients who did not report any ZIP code, or patients from ZIP codes whose number of cases fell below a minimum level. These patients were removed from the analysis. As described above, patient records in ZIP codes not represented by ZCTAs were added to those ZIP codes corresponding to the ZCTAs that they fell inside or were closest to. When consolidating ZIP codes into ZCTAs, any ZIP code with no value reported was treated as having a value of 0. If two or more ZIP codes were combined into a single ZCTA, and at least one of those ZIP codes had a value reported, all other ZIP codes with a masked value were treated as having values of 0. Thus ZCTA values were recorded as NA only if all ZIP codes contributing values to them had masked values reported for all associated ZIP codes.

The next step in the analysis process was to calculate rates for each of these variables. However, rather than calculating raw rates, empirical Bayes smoothed rates (EBR) were created for all variables possible³³. Smoothed rates are considered preferable to raw rates for two main reasons. First, the small population of many ZCTAs, particularly those in rural areas, meant that the rates calculated for these areas would be unstable. This problem is sometimes referred to as the small number problem. Empirical Bayes smoothing seeks to address this issue by adjusting the calculated rate for areas with small populations so that they more closely resemble the mean rate for the entire study area. The amount of this adjustment is greater in areas with smaller populations, and less in areas with larger populations.

Because the EBR were created for all ZCTAs in the state, ZCTAs with small populations that may have unstable high rates had their rates "shrunk" to more closely match the overall variable rate for ZCTAs in the entire state. This adjustment can be substantial for ZCTAs with very small populations. The difference between raw rates and EBR in ZCTAs with very large populations, on the other hand, is negligible. In this way, the stable rates in large population ZIP codes are preserved, and the unstable rates in smaller population ZIP codes are shrunk to more closely match the state norm. While this may not entirely resolve the small number problem in all cases, it does make the comparison of the resulting rates more appropriate. Because the rate for each ZCTA is adjusted to some degree by the EBR process, it also has a secondary benefit of better preserving the privacy of patients within the ZCTAs.

EBR were calculated for each variable using the appropriate base population figure reported for ZCTAs in the American Community Survey 5-year estimate tables: overall EBR for ZCTAs were calculated using total population; and sex, age, and normalized race/ethnicity EBR were calculated using the appropriate corresponding population stratification. In cases where multiple years of data were aggregated, populations for the central year were used and multiplied by the number of years of data to calculate rates. For OSHPD data, 2012 population data was used. For multi-year CDPH variables (2010 – 2012), 2011 data was used. Population data from 2012 was used to calculate single-year CDPH variables.

ZCTAs with NA values recorded were treated as having a value of 0 when calculating the overall expected rates for a state as a whole, but were kept as NA when smoothing the value for the individual ZCTA. This meant that smoothed rates could be calculated for each variable in each area, but if a given ZCTA had a value of NA for a given variable, it retained that NA value after smoothing.

EBR were attempted for every overall variable, but could not be calculated for certain variables. In these cases, raw rates were used instead. The final rates in either case for H, ED, and the basic mortality variables were then multiplied by 10,000, so that the final rates represent H or ED discharges, or deaths, per 10,000 people.

Age Adjustment

The additional step of age adjustment³⁴ was performed on the all-cause mortality variables. Because the occurrence of these conditions varies as a function of the age of the population, differences in the age structure between ZCTAs could obscure the true nature of the variation in their patterns. For example, it would not be unusual for a ZCTA with an older population to have a higher rate of ED visits for stroke than a ZCTA with a younger population. In order to accurately compare the experience of ED visits for stroke between these two populations, the age profile of the ZCTA needs to be accounted for. Age adjusting the rates allows this to occur.

To age adjust these variables, we first calculated age stratified rates by dividing the number of occurrences for each age category by the population for that category in each ZCTA. Because estimates of age less than 1 year and from 1 to 4 years were not available in the American Community Survey datasets used in this analysis, the proportion of the population under age 5 that was also under age 1 was calculated using 2010 decennial Census data for each geographic area. These proportions were then compared to the age under 5 variables from the American Community Survey datasets for each geographic area to estimate the values for the population less than age 1 and from 1 to 4 years. These estimated values were then used to calculate age stratified rates. Age stratified EBR were used whenever possible. Each age stratified rate was then multiplied by a coefficient that gives the proportion of California's total population that was made up by that age group as reported in the 2010 Census. The resulting values are then summed and multiplied by 10,000 to create age adjusted rates per 10,000 people.

Benchmark Rates

A final step was to obtain or generate benchmark rates to compare the ZCTA level rates to. Benchmarks for all OSHPD variables were calculated at the HSA, county, and state levels. HSA rates were calculated by first summing the total number of cases and relevant populations for each variable across all ZCTAs in the HSA. ZCTAs with NA values were treated at this stage as having a value of 0. Smoothed EBR rates were then calculated for each HSA using a broader set of HSAs.

County benchmark rates were calculated as raw rates for each county, or in the case of small counties, group of counties, using the relevant population variables. State rates were calculated as raw rates by first summing all county level values (treating an NA value as a 0), and then dividing these values by the relevant population value.

HSA, county, and state benchmark rates were also provided for CDPH data. HSA benchmarks were calculated in a process similar to that described above for OSHPD HSA benchmarks: the total number of cases and relevant populations were summed for each variable across all ZCTAs in the HSA, and used to calculate smoothed EBR rates using a broader set of HSAs.

County and state benchmark rates were either calculated using CDPH data reported at the county and state level^{35,36}, or else obtained from the County Health Status Profiles 2014³⁷. The resulting benchmark values for CDPH and OSHPD variable were all reported as rates per 10,000 unless the original variable was reported using some other standard as described below.

Processing for Specific Variables

Additional processing was needed to create the Community Health Vulnerability Index (CHVI), the CDPH related variables, and as well as some of the other variables. The process used to calculate these variables are described in this section below.

Community Health Vulnerability Index (CHVI)

The CHVI is a health care disparity index largely based on the Community Need Index (CNI) developed by Dignity Health³⁸. The CHVI uses the same basic set of demographic variables to address health care disparity as outlined in the CNI, but these variables are aggregated in a different manner to create the CHVI. For this report, the following nine variables were obtained from the 2013 American Community Survey 5-year Estimate dataset at the census tract level:

- Percent Minority
- Population 5 Years or Older who speak Limited English
- Percent 25 or Older Without a High School Diploma
- Percent Unemployed
- Percent Families with Children in Poverty
- Percent Households 65 years or Older in Poverty
- Percent Single Female Headed Households in Poverty
- Percent Renter Occupied Households
- Percent Uninsured

All census tracts that crossed ZCTAs within the HSA were included in the analysis. Each variable was scaled using a min-max stretch, so that the tract with the maximum value for a given variable within the study area received a value of 1, and the tract with the minimum value for that same variable within the study area received a 0. All scaled variables were then summed to form the final CHVI. Areas with higher CHVI values therefore represent locations with higher concentrations of the target index populations, and are likely experiencing poorer health care disparities.

Infant Mortality Rate

Infant mortality rate reports the number of infant deaths per 1,000 live births. It was calculated by dividing the number of deaths for those less than 1 year of age from 2010 - 2012 by the total number of live births for the same time period (using smoothed EBR), and multiplying the result by 1,000.

Teen Pregnancy Rate

Teen Pregnancy Rate reports the number of live births to mothers under the age of 20 per 1,000 females between the ages of 15 and 19. It was calculated by dividing the number of live births to mothers whose age at delivery was under 20 reported in 2010 - 2012 by three times the total population of females from ages 15 to 19 in 2011 (using smoothed EBR), and multiplying the result by 1,000.

Life Expectancy at Birth

Life expectancy at birth values are reported in years, and were derived from period life tables created in the statistical software program R³⁹ using the Human Ecology, Evolution, and Health Lab's⁴⁰ example period life table function. This function was modified to calculate life tables for each ZCTA, and to allow the life table to be calculated from submitted age stratified mortality rates. The age stratified mortality rates were calculated for each ZIP code by dividing the total number of deaths in a given age category from 2010 - 2012 by three times the ZCTA population for that age group in 2010 (smoothed to EBR). The age group population was multiplied by three to match the three years of mortality data that were used to derive the rates. Multiple years were used to increase the stability of the estimates.

Years Potential Life Lost (75)

Years Potential Life Lost (75) is a metric that can be used to compare health status across populations that better accounts for premature loss of life than many other metrics⁴¹. It was calculated here following the method described by Dranger and Remington⁹. In brief, this involved calculating EBR smoothed age stratified death rates using CDPH data from 2010 – 2011. For each age stratification group under 75 years of age, the midpoint age of the group was subtracted from 75, and the resulting value was multiplied by the smoothed age stratified rate. The resulting values for each age stratification were then age adjusted using a 2010 California base population. These values were then individually multiplied by 10,000 and summed across all age groups to estimate the years of potential life lost before 75 out of 10,000 people.

Diversity Index

The diversity index was calculated to measure the racial and ethnic diversity of geographic regions within the HSA. It was calculated using concepts from Iceland⁴², but using the Shannon's evenness index (Beals, Gross, & Harrell, 2000) rather than the specific methodology described therein. The diversity index represents how evenly population within a given geographic unit is divided between the following seven racial/ethnic groups (described previously): Asian, Black, Hispanic, American Indian, Pacific Islander, White, Other or Two or More Races. Diversity index values range between 0 and 1, with a value of 0 in areas where the entire population belongs to just one racial/ethnic group and a value of 1 in areas with population evenly divided between the seven groups. Readers interested in the specifics of index calculation are referred to the previously listed sources.

Major Crime and Domestic Violence Rates

Major crimes and domestic violence related calls for assistance reported in the State of California Department of Justices' Crime Data reports are listed by reporting police agency. In order to estimate major crime and domestic violence rates, these values need to be associated with particular geographic areas, and then divided by those area populations. This was done for this report by comparing the names of police agencies to populations reported for "places" (including both incorporated and unincorporated areas) by the US Census. Both crime and population data were obtained for 2013.

⁴² Iceland, J. (2004). *The Multigroup Entropy Index (Also Known as Theil's H or the Information Theory Index)*. US Census Bureau. Retrieved June 20, 2015, from

Many reporting agencies, such as those associated with hospitals, transit and freight rail lines, university campuses, and state and federal agencies, did not correspond to a specific census place. Internet searches were used to identify the Census places they were associated with, and their cases were added to those places. For example, the crimes or calls for assistance reported by a University police department were added to the city or county that the university campus was located in. For areas where this was unclear based on the name alone, internet searches were conducted to determine the place an agency fell inside of. Because reported crimes or calls for agencies were organized by county, if the crimes for an agency could not be associated with any specific place, its reported crimes were grouped together with those for the county sheriff's department.

To calculate rates, the total number of crimes or calls for assistance for each Census place resulting from the process described above was divided by the population of that place and multiplied by 10,000 to report the number of crimes per 10,000 in that place. For crimes reported for (or grouped with) the county sheriff's department, the county population was modified by subtracting the total population of all Census places with reported crimes. This meant that the major crime rate reported for the county was reporting not the total county's crime rate, but the rate of crimes occurring in those portions of the county that were not otherwise covered by another reporting agency.

Overall county major crime rates and domestic violence related calls for assistance were, however, calculated for benchmarking purposes by summing the total number of major crimes reported by any agency within the county, dividing that by the total population of the county, and multiplying the result by 10,000. For further detail as to which specific crimes are covered within the "major crime" category, interested readers are referred to the State of California Department of Justices' Crime Data reports, available online at: http://oag.ca.gov/crime.

Park Access

The park access variable reports the percent of the 2010 population residing within each ZCTA that lives in a Census block that intersects a ½ mile buffer around the closest park. ESRI's U.S. Parks data set⁴³, which includes the location of local, county, regional, state, and national parks and forests, was used to determine park locations.

Modified Retail Food Environment Index (mRFEI)

The Modified Retail Food Environment Index (mRFEI) variable reports the percentage of the total food outlets in a ZCTA that are considered healthy food outlets. Values below 0 are given for ZCTAs with no food outlets. The mRFEI variable was calculated using a modification of the methods described by the National Center for Chronic Disease Prevention and Health Promotion⁴⁴ using ZIP code level data obtained from the US Census Bureau's 2013 County Business Pattern datasets. Healthy food retailers were defined based on North American Industrial Classification Codes (NAICS), and included:

- Large grocery stores: NAICS code 445110, with 50 or more employees
- Fruit and vegetable markets: NAICS 445230
- Warehouse clubs: NAICS 452910

Food retailers that were considered less healthy included:

- Small grocery stores: NAICS code 445110, with 1 4 employees
- Limited-service restaurants: 722513
- Convenience stores: 445120

To calculate the mRFEI, ZIP code values were converted to ZCTAs using previously described processes. The total number of health food retailers was then divided by the total number of healthy and less healthy

food retailers for each ZCTA, and the result was multiplied by 100 to calculate the final mRFEI value for the ZCTA. HSA mRFEI benchmark values were calculated by first summing the total number of each type of food retailer that fell within the HSA, and then by following the same approach.

Appendix C: Detailed Analytic Methodology including SHN Categorization

Significant Health Need Identification Process

The Significant Health Need identification process began with a review of significant health needs identified in the Community Health Need Assessment reports conducted by Valley Vision, Inc. during the 2013 CHNA round. This list of significant health needs was compared to preliminary secondary data, health needs associated with the Kaiser Permanente Community Commons Data Platform (CCDP), and input from health systems participating in the Sacramento Region 2016 collaborative CHNA process. This culminated in the final set of 8 potential health needs for the 2016 CHNA shown in Table 38 below.

Table 38: Potential Health Needs

Table 38: Overview of Potential Health Need (PHN) Categories								
Potential Health Need Category	Abbreviation							
Access to High Quality Health Care and Services (i.e., Access to Care, Oral Health, Maternal and Infant Health)	Access to Care							
Access to Behavioral Health Services (i.e., Mental Health, Substance Abuse)	Behavioral Health							
Affordable and Accessible Transportation	Transportation							
Basic Needs (i.e., Food, Housing, Employment, Education)	Basic Needs							
Disease Prevention, Management and Treatment (i.e., Cancer, Asthma, CVD/Stroke, HIV/AIDS/STIs)	Disease Prevention							
Active Living and Healthy Eating	ALHE							
Pollution Free Living and Work Environments	Pollutant Free							
Safe, Crime and Violence-Free Communities	Safe Communities							

The next step in the significant health need identification process was to identify those secondary indicators associated with each of these significant health needs. Values for these indicators were then calculated for each hospital service area, and then compared to relevant state benchmarks. The percentage of indicators comparing poorly to state benchmarks for each health need was then calculated. Table 39 below shows the indicator/health need cross walk table, shows which variables were collected directly by Valley Vision and which were obtained through the CCDP. It finally gives a general description of the type of value calculated for the HSA for each variable, as well as the direction of comparison to the state benchmark.

Table 39: Indicators, Health Needs, and Benchmarks

The qualitative indicators associated with each potential health need category were identified in a crosswalk table. The transcripts from the key informant and community focus group interviews were coded to the qualitative indicators or themes in order to get a better understanding of the specific health issues within the communities that were interviewed. A full list of the qualitative indicators with each potential health need category is displayed below in Table 40.

Table 40: Qualitative Indicators Associated with Potential Health Needs

Potential Health	Qualitative Indicators
Need Category	
	Continuity of care/coordinated care
A acces to III als	Cost of care/prescription cost/copays
Access to High Quality Health	Culturally sensitive care
Care and Services	Delayed care
Care and Services	Dental/oral health
	Distance/transport to care

Potential Health	Qualitative Indicators
Need Category	
	ER overwhelm/ overutilization
	Health care for the undocumented
	Health education/ health literacy
	Insurance restrictions/ coverage gaps
	Language barriers
	Long wait times/limited providers/impacted system
	Maternal infant health
	Medi-Cal access
	Pain management
	Patient navigation/referral
	Prevention services/preventative care
	Primary care
	Senior care services
	Specialty care
	Mental Health
	Comorbidity
	Depression-anxiety
	Desire for alternative treatment
	Elderly-Alzheimer's-dementia
	ER/ Hospital
	• Homelessness
	Limited services-lack of capacity
	Mental health/substance abuse
	Need for culturally sensitive care
	Serious mental Illness
	Stigma/discrimination
	• Stress
Access to	• Suicide
Behavioral Health	Trauma and/or ACEs
Services	Substance Abuse
	Alcohol and other drugs
	Barriers to accessing services
	• Co-morbidity
	Criminalization of drugs
	Geographic-safety concerns
	• Homelessness
	Limited resources/capacity
	Methamphetamines-cocaine
	Mental health/substance abuse
	• Opiates
	Outreach and education
	Parental and prenatal use
	Transition aged youth
1.00 1.11	Tobacco-E cigs
Affordable and	Lack of transport as a barrier to access health care services
Accessible	 Lack of transport as a barrier to access healthy foods

Potential Health	Qualitative Indicators
Need Category	Quantum vo maiomons
Transportation	Long distance and difficulty accessing health care services
Transportation	 No active transport infrastructure
	 Personal transportation barriers
	 Public transportation barriers
	Housing
	Gentrification/displacement
	Housing discrimination
	Housing discrimination Homelessness/shelter crisis
	 Lack of affordable housing
	 Role of public housing agencies
	 Role of public flouring agencies Seniors/aging in place
	 Substandard housing
	Food Security
	Food banks, pantries, closets Look of quantity and quality of school food
	Lack of quantity and quality of school food Sofety not programs (Collegel, WIC, Moels on Wheels)
	• Safety net programs (CalFresh, WIC, Meals on Wheels)
Basic Needs	Transportation barriers Formatic Security
	Economic Security
	Loss of safety net benefits Need for ich twining resources.
	Need for job training resources Soft and the State (TANE CLIE to WIC)
	• Safety net benefits (TANF, CalFresh, WIC)
	Stigma/shame of poverty
	Unemployment/lack of jobs Filmentian
	Education V. 12
	Differences in K-12 opportunity CER 1: 1
	Educational attainment (dropouts, GED, higher Ed)
	Financial education and literacy
	Health education and literacy
	High cost of education
	Need for cultural sensitivity
	School discipline issues
	Asthma
	Air pollution/contamination
	Anti-smoking laws and regulations
	Cost of asthma medications
	• Environmental triggers (dust, mites, cockroaches, mold)
Disease	Secondhand smoke (cigarettes/marijuana)
Prevention,	• Smoke shops
Management and	Cancer
Treatment	Air pollution exposure
	Breast cancer
	Cancer screening programs
	Cervical cancer
	Colorectal cancer
	Early detection

Qualitative Indicators
Lack of healthy eating and active living opportunities
• Lung cancer
Oncology/oncologists
Pesticide exposure
Prevention and education
Prostate cancer
Stomach cancer
CVD/Stroke
• Congestive heart failure (CHF)
Cost of medication
• CVD/Stroke
Diagnosis, management, and treatment
Lack of healthy eating and active living opportunities
• Hypertension
• Stroke
HIV/AIDS/STDs
Diagnosis, management, and treatment of STIs
Incidence/prevalence
Lack of continuity between health systems and public health
Need for reproductive health education
Stigma/discrimination
Vulnerable populations
• Biking
CalFresh (EBT) and WIC
Community gardens
Cost barriers
Cost of healthy food
Cultural barriers
Need for education and classes
• Farmers markets
• Food access issues
• Food deserts
Food distribution
• Gyms
Lack of motivation
Lack of sidewalks or bike lanes
• Lack of time
Lack of transportation
Natural environment (trails and rivers)
Perishability of fresh foods
Public parks/pools
Recreation opportunities
• Safety
School physical activity
Technology and screen time
Unhealthy food options

Potential Health Need Category	Qualitative Indicators
	Walking and walkability
Pollution-Free Living and Work Environments	 Air quality Environmental hazards/toxins (cockroaches, mold, mildew, asbestos) Respiratory conditions (asthma, COPD, infections, allergies) Second hand smoke (tobacco and marijuana) Transportation
Safe, Crime and Violence-Free Communities	 Alcohol abuse Bullying Child abuse and trauma Child Protective Services Domestic Violence Drug dealing Gang violence Gun and knife violence Hate crimes Homicide Human Trafficking Motor vehicle accidents Pedestrian accidents Prostitution Rape and sexual assault Substance Use Tension with police Theft

Appendix D: Informed Consent

Informed Consent

Gathering Information for a Community Health Assessment

Purpose:

You have been invited to participate in a community health assessment. This assessment will help to inform area leaders on the specific needs of the communities which they serve. We will focus our questions on two main topics: 1) the health status of the community at large, and 2) the factors that help or prevent community members from living a healthy life. The information we gather from you will be combined with that of other interviews and focus groups. We will summarize these findings and report these to local leaders in your area.

Procedures:

The interview will capture your own experiences and opinions about community health issues. Completion of the questionnaire and the interview will take about 1 hour. We will also record and later transcribe the session. All identifying information will be removed from the transcripts and at the end of the project the recording will be destroyed.

Potential Risks or Benefits:

Some of the interview questions may be emotionally charged; otherwise there are no risks that we are aware of to answering the questions presented. There are no direct benefits to participating in this interview.

Participant's Rights:

Both completion of a short questionnaire and participation in this interview are completely voluntary; you may choose to not participate and terminate your involvement at any time.

Confidentiality and Anonymity:

Should you choose to participate, you will receive a copy of this consent form. The information you provide and anything you share with us will be kept in the strictest confidence. We will list your organization and or job title in the final report and may use quotes from the transcript of your interview, however, these will not be associated with your name directly. These forms and any information you provide will be kept in a secure location and there will be no link between the information we collect and this document.

How to obtain Additional Information:

If you have any questions or comments regarding this document, interview or final report please contact: Anna Rosenbaum, Health Equity Manager at Valley Vision (www.valleyvision.org) 916-325-1630.

I hereby agree to participate in this interview, understand that I will be provided a copy of this consent form for my own records, and acknowledge that my responses will be recorded.

Informed Consent Gathering Information for a Community Health Assessment

Purpose:

You have been invited to participate in a focus group for a community health needs assessment. This assessment will help to inform area leaders on the specific needs of the communities which they serve. We will focus our questions on two main topics: 1) the general health of the community, and 2) the factors that help or prevent community members from living a healthy life. The information we gather from you will be combined with that of other interviews and focus groups. We will summarize these findings and report these to local leaders in your area.

Procedures:

The focus group will capture your own experiences and opinions about community health issues. Completion of the questionnaire and the focus group will take about 90 minutes. We will also record and later transcribe the session. All identifying information will be removed from the transcripts and at the end of the project the recording will be destroyed.

Potential Risks or Benefits:

Some of the focus group questions may be emotionally charged otherwise there are no risks that we are aware of to answering the questions presented. Benefits include contributing to an important health assessment, along with compensation outlined below.

Participant's Rights:

Both completion of a short questionnaire and participation in this focus group are completely voluntary; you may choose to not participate and terminate your involvement at any time.

Compensation:

For your participation in the focus group you will be given a \$10 gift card to a local retail outlet. Gifts cards will be distributed after completion of the focus group. If you are not able to complete the focus group you will not receive a gift card.

Confidentiality and Anonymity:

Should you choose to participate, you will receive a copy of this consent form. The information you provide and anything you share with us will be kept in the strictest confidence. We may use quotes from the focus group transcript; however they will not be associated with your name directly. These forms and any information you provide will be in a secure location and there will be no link between the information we collect and this document.

How to obtain Additional Information:

If you have any questions or comments regarding this document, the questionnaire, focus group, or final report please contact: Anna Rosenbaum, Data Manager at Valley Vision (www.valleyvision.org) 916-325-1630 (office).

I hereby agree to participate in this focus group, understand that I will be provided a copy of this cor	nsent
form for my own records, and acknowledge that my responses will be recorded.

Consentimiento Informado

Acumulando Información para conducir una Evaluación de las Necesidades de Salud de la Comunidad

Objetivo:

Usted ha sido invitado a participar en un grupo de enfoque para la evaluación de las necesidades de la salud de la comunidad. Esta evaluación le ayudará a informar a los líderes de la zona en las necesidades específicas de las comunidades a las que sirven. Nuestras preguntas se concentraran en dos temas principales: 1) la salud general de la comunidad, y 2) los factores que ayudan o que impiden a los miembros de la comunidad vivir una vida saludable. La información que juntamos de usted será combinada con los resultados de otras entrevistas y grupos de enfoque. Vamos a resumir estas conclusiones y reportar éstos resultados a los líderes de su área.

Procedimientos:

El grupo de enfoque captura tus propias experiencias y opiniones sobre temas de la salud de la comunidad Realización de un cuestionario y el grupo de enfoque tomara aproximada mente un hora y media (1 ½). Nos gustaría grabar la sesión y luego transcribir la. Toda la información de identificación será borrada de las transcripciones y al final del proyecto, la grabación será destruida.

Riesgos Potenciales o Beneficios:

Algunas preguntas pueden ser emocionalmente cargadas, a lo contrario, no hay ningún riesgo que estemos consciente al contestar las preguntas presentadas. Los beneficios por su participación en este grupo de enfoque incluye la oportunidad de participar en una evaluación importante y una tarjeta de regalo de 10 dólares (más detalles abajo).

Los Derechos del Participante:

La participación en este grupo de enfoque y en el cuestionario es completamente voluntaria, usted puede decidir a no participar y puede terminar su participación en cualquier momento que usted desea.

Compensación

Recibirá una tarjeta de regalo de \$10 para una tienda local por participar en el grupo de enfoque. Después de completar el grupo de enfoque, le daremos la tarjeta de regalo. Si no eres capaz de completar el grupo de enfoque no recibirá tarjeta de regalo.

Confidencialidad y Anonimato

Si usted decide participar, usted recibirá una copia de esta forma de consentimiento. La información que usted nos dará será mantenida con la confidencialidad más estricta. Usted no será identificado en ninguna manera, su nombre no aparecerá en ningún documento y sólo el investigador tendrá el acceso a estos documentos. Estas formas y cualquier información coleccionada serán guardadas en una ubicación segura y no habrá ningún enlace entre la información que coleccionamos y este documento.

Como obtener más Información:

Si tienes preguntas en par de esta forma, el cuestionario, el grupo de enfoque o el reporte final, póngase en contacto con Giovanna Forno, de Valley Vision (www.valleyvision.org) 916-325-1630 (oficina).

Por este medio consiento en participar en el grupo de enfoque y reconozco que mis repuestas serán grabadas. También entiendo que me van a dar una copia de esta forma de consentimiento para mis propios archivos.

Key Informant Interview Guide - Questions

- 1. Please, tell me (us) about the community you serve.
 - Follow up: What are the specific geographic areas and/or populations served?
- 2. How would you describe the quality of life in the community you serve?
- 3. Please describe the health of the community you serve.
 - Follow up: What are the biggest health issues and/or conditions that your community struggles with?
- 4. Of the health issues you've mentioned, which would you say are the most important or urgent to address?
 - Follow up: How would you rank these health issues in terms of importance?
- 5. What specific locations struggle with health issues the most?
 - Follow up: What specific groups in the community struggle with these health issues the most?
- 6. What are the challenges to being healthy for the community you serve?
- 7. What policies, laws, or regulations prevent the community from living healthy lives?
- 8. What resources exist in the community to help people live healthy lives?
- 9. What would you say has been the impact of the Affordable Care Act [may also be known as Covered California, Obamacare] on the community you serve?
- 10. What is [or who is] needed to improve the health of your community?
- 11. Can you recommend 1 or 2 additional people, groups or organizations you think would be most important to speak to about the health of the community?
- 12. Is there anything else you would like to share with our team about the health of your community [that hasn't already been addressed]?

- 1. Please, tell us about the community you live in.
 - · Follow Up: What are the specific neighborhoods?
 - Follow Up: What types of people live there (race, age, legal status)?
- 2. How would you describe the quality of life in your community?
- 3. How would you describe the health of the community where you live?
- 4. Of the health issues you've mentioned, which would you say are the most important or urgent to address?
 - Follow up: How would you rank these health issues in terms of importance?
- 5. What specific neighborhoods or places in your community struggle with health issues the most?
 - Follow up: What specific groups in the community struggle with these health issues the most?
- 6. What are the challenges to being healthy in your community?
- 7. What rules or laws prevent your community from being healthy?
- 8. What resources exist in your community to help people live healthy lives?
- 9. What would you say has been the impact of universal health care coverage [may also be known as Covered California, Obamacare, ACA] on your community?
- 10. What is needed to improve the health of your community?
- 11. Is there anything else you would like to share with our team about the health of your community [that hasn't already been addressed]?

- 1. Please, tell us generally about the community you live in.
 - What are the specific neighborhoods? What types of people live there?
 - How would you describe your neighborhood to someone who has never been there?
 - How would you describe the physical environment?
- 2. Is life easy or difficult for most people? Why?
 - What does everyday life look like for most people?
- 3. What are the biggest health issues that people in your community struggle with?
 - What health issues do you see or hear about from friends and family?
- 4. What specific groups of people in your community struggle with health issues the most?
 - Do you see any differences in health by age, race, gender, sexual orientation, legal status?
 - · Where do these groups live?
- 5. What are the challenges to being healthy in your community?
 - Do people engage in healthy or unhealthy behavior where you live?
 - Is it easy or hard to make healthy choices in your neighborhood? (g.g. access to healthy foods, places to exercise, access to health care)
 - Is your neighborhood supportive of health? (g.g. sidewalks, safe streets, safe places to exercise, social supports)
- 6. Of the health issues we've talked about, which would you say are the most important or urgent to address?
 - How would you rank these health issues in terms of importance?
- 7. What resources exist in your community to help people live healthy lives?
 - What are the barriers to accessing these resources?
 - What are gaps in these resources? What resources are missing?
- 8. What is needed to improve the health of your community?

Guía de Grupo de Enfoque

Acumulando Información para conducir una Evaluación de las Necesidades de Salud de la Comunidad

- 1. Por favor, díganme de la comunidad adonde ustedes viven.
 - Seguimiento: ¿Cuáles son los barrios específicamente?
 - . Seguimiento: ¿Qué tipos de personas viven alli? (edad, raza, genero, estatus legal)
- 2. ¿Cómo es la vida en la comunidad adonde ustedes viven?
- 3. Por favor, describen la salud de la comunidad adonde ustedes viven
- 4. ¿De los problemas de salud que han comentado, cuales son los más importantes de resolver?
 - <u>Seguimiento</u>: ¿Estos son los problemas de salud que han dijeron... cuales son los más importantes/urgentes de resolver?
- 5. ¿Qué grupos específicos (tipos de gente por edad, raza, genero, estatus legal) en tu comunidad luchan lo más con estos problemas de salud?
 - Seguimiento: ¿Qué áreas o barrios específicos luchan con problemas de salud lo más?
- 6. ¿Cuáles son las barreras para vivir saludable en la comunidad adonde ustedes viven?
- 7. ¿Qué tipos de leyes, reglas, o prácticas impiden tu comunidad de vivir saludable?
- 8. ¿Qué recursos existen en tu comunidad para ayudar las personas vivir saludable?
- ¿El Affordable Care Act ha impactado la comunidad adonde ustedes viven? [también se conoce como Covered California, Obamacare]
- 10. ¿Qué es necesario para mejorar la salud de tu comunidad?
 - Seguimiento: ¿Hay algún tipo de persona que podría ayudar mejorar la salud de la comunidad?
- 11. ¿Hay algo más que les gustaría compartir con nosotros la salud de la comunidad?
 - Seguimiento: ¿Hay preguntas?

2016 Community Health Needs Assessment – Greater Sacramento Region

Project Summary January 2015 - June 2016

Valley Vision - www.valleyvision.org, (916) 325-1630

2320 Broadway, Sacramento, CA 95818

- Sarah Underwood, MPH Project Manager, sarah.underwood@valleyvision.org

Organization Information:

Management:

Project

Valley Vision is a social enterprise that tackles economic, environmental and social issues. Our vision is a prosperous and sustainable region for all generations. Founded in 1994, Valley Vision provides research, collaboration, and leadership services to make the greater Sacramento Region prosperous and sustainable. We have conducted CHNAs for the four hospital systems the region since 2007.

Project Overview:

The 2016 Community Health Needs Assessment (CHNA) is a collaborative project that assesses the health status of communities in the Sacramento region. Nonprofit hospitals are required to conduct CHNAs every three years and to adopt implementation plans that address the community health needs identified through the assessment. CHNAs collect input from broad interests across the community, including hospitals, public health, residents and other stakeholders. The findings help hospitals to understand the health status and needs of the communities they serve, and to direct their community benefits programs and activities accordingly. The 2013 CHNA reports are available online at www.healthylivingmap.com, and the 2016 reports will be available in the spring of 2016.

Key Deliverables:

Each CHNA report will:

- Describe the health status of the community served by a hospital facility;
- Identify significant health issues that exist within the community and the factors that contribute to those health issues;
- Determine priority areas and actions for health improvement; and
- Identify potential resources that can be leveraged to improve community health.

Strategic Partners:

Lead project consultation:

Dr. Heather Diaz

Data collection, analysis and GIS mapping:

Transcription and translation services: Cherie Yure Southern California Transcription

Services

Education Dept of Kinesiology & Health Sciences

Associate Professor, Community Health

CSU Sacramento

Dr. Mathew C. Schmidtlein Assistant Professor Dept of Geography CSU Sacramento

Project Orientation:

Health status indicators will be compiled in a database and analyzed to identify geographic areas in each hospital service area (HSA) where socio-economic and demographic factors result in health disparities. Interviews with health service providers and community key informants will be conducted to better understand the health needs of the communities served by each hospital facility. Focus groups will be conducted with medically underserved, low-income, and minority populations to understand their unique and specific health needs and barriers to care. The health needs identified within each HSA will be categorized and organized to identify the significant health needs within each HSA and to prioritize these significant health needs. All findings will be compiled into a comprehensive report that will inform the healthcare systems in creating implementation plans to direct their community benefit programs and activities.

2016 Community Health Needs Assessment (CHNA)

About the CHNA Project

About the **CHNA**

The 2016 Community Health Needs Assessment (CHNA) is a collaborative project that looks at the health of the Sacramento region. The four nonprofit hospital systems in the region (Sutter, UC Davis, Kaiser and Dignity) work together to conduct health assessments of the communities they serve. The assessments are then used by the hospital systems to develop plans to improve the health of these communities.

The CHNA Reports

Each CHNA report includes:

- A description of the health of the community served by a hospital facility;
- The health issues within the community and the factors contributing to those health issues;
- The areas and communities that are most affected by these health issues;
- The health needs that are most important to improve overall health for the community;
- Potential resources and services that are available to improve community health.

Previous CHNA reports are available online at http://www.healthylivingmap.com (see 2013 CHNA Reports), and the 2016 reports will be available in the Fall of 2016.

How the **Project Works**

To get information about the health of the community, we talk to many different groups of people including medical providers, public health workers, community organizations, and residents. We ask people to share information with us about: (1) the health issues they see and experience in their communities; (2) the challenges and opportunities to be healthy in their communities; and (3) the resources that may or may not be available to help people live healthy lives. We then look for patterns or themes in what we hear from the community and identify the priority health needs to be included in the CHNA reports. The reports are then used to help the hospital systems decide which community services and programs to support.

About Us

Valley Vision is an organization that works on economic, environmental and social issues. Our vision is to help create a healthy region for all generations through learning about the community, working with other organizations and helping to lead teams of people. We have worked with the four hospital systems in the Sacramento region on this project since 2007.

Evaluación de las necesidades de salud de la comunidad-2016

Acerca de la evaluación

Acerca de la evaluación

La evaluación de las necesidades de salud de la comunidad del año 2016 es un proyecto colaborativo que analiza la salud de la región de Sacramento. Los cuatro sistemas de hospitales sin fin de lucros en la región (Sutter, UC Davis, Kaiser y Dignity) trabajan juntos para conducir evaluaciones de la salud de las comunidades que ellos sirven. Los resultados de las evoluciones son usados por los sistemas de hospitales para desarrollar planes para mejorar la salud de estas comunidades.

Que incluye la evaluación

Cada evaluación incluye:

- Una descripción de la salud de la comunidad atendida por un centro hospitalario
- Los problemas de salud en la comunidad y los factores que contribuyen a esos problemas de salud
- Las zonas y comunidades que son las más afectadas por estos problemas de salud
- Las necesidades de salud que son las más importante de mejorar para la salud general de la comunidad
- Los recursos y servicios potenciales que están disponibles para mejorar la salud de la comunidad

Evaluaciones anteriores están disponibles por la página http://www.healthylivingmap.com (vea 2013 CHNA Reports), y los reportes de 2016 serán disponibles en el otoño de 2016.

Como se conduce la evaluación

Para obtener información de la salud de la comunidad, hablamos con muchos diferentes grupos de gente incluyendo proveedores médicos, trabajadores de salud pública, organizaciones comunitarias y residentes. Pedimos que personas comparten información con nosotros acerca de (1) los problemas de salud que ellos ven y experiencia en sus comunidades, (2) los desafíos y oportunidades para vivir saludable en sus comunidades y (3) los recursos potenciales que son disponibles para ayudar personas vivir saludable. Después, buscamos patrones o temas en lo que escuchamos de la comunidad para identificar las necesidades de salud prioritarios que serán incluidos en el reporte final. Los reportes son usados para ayudar los sistemas de hospitales decidir cuales servicios y programas comunitarias apoyar.

Acerca de Valley Vision

Valley Vision es una organización que trabaja en problemas económicos, ambientes y sociales. Nuestra visión es ayudar creer una región saludable para todas generaciones atreves de aprender de nuestra comunidad, trabajar con otras organizaciones y ayudar a liderar equipos de gente. Hemos trabajado con los cuatro sistemas de hospitales en la región de Sacramento en este proyecto desde el año 2007.
